> I have the exact same problem with my Midland 77-113, with the
exception that it doesn't work at all now. I opened up the radio to
look for anything out of the ordinary and noticed a small tin-
like "box" that is full of a wax like substance, this "substance" had
leaked out and basically glued over a couple of the solders. I'm not
that knowledgeable about this sort of thing or exactly what the "small
box" is. I have tried just about everything other than taking it to the
shop to see what the problem is. The funny thing is that it receives
the weather channels but doesn't receive or transmit on AM. I have
hooked up different mics, antennas, wiring to different power sources,
ground wires, etc and still no luck.

It would prove it is your amp and not a picture of one off the internet.
Your soldering iron next to it will do fine. If you cannot produce this
picture
you are a fraud. You have the digital camera no excuses.

1. The Halloween pumpkin on your front porch has more teeth than your spouse.

2. You let your twelve-year-old daughter smoke at the dinner table in front of her kids.

3. You've been married three times and still have the same in-laws.

4. You think a woman who is "out of your league" bowls on a different night.

5. Jack Daniels makes your list of "Most Admired People."

6. You wonder how service stations keep their restrooms so clean.

7. Anyone in your family ever died right after saying, "Hey, watch this."

8. You've got more than one brother named 'Darryl.'

9. You think that Dom Perignon is a Mafia leader.

10. Your Junior/Senior Prom had a Daycare.

11. You think the last words to The Star Spangled Banner are, "Gentlemen, start your engines."

12. You lit a match in the bathroom and your house exploded right off its wheels.

13. The bluebook value of your truck goes up and down, depending on how much gas it has in it.

14. You have to go outside to get something out of the'fridge.

15. One of your kids was born on a pool table.

16. You need one more hole punched in your card to get a freebie at the House of Tattoos.

17. Your wife's hairdo was once ruined by a ceiling fan.

18. Ya can't get married to yer sweetheart 'cause there's a law against it.

19. You dated one of your parents' current spouses in high school.

20. You think loading the dishwasher means getting your wife drunk.

21. Your school fight song is "Dueling Banjos."

22. Your toilet paper has page numbers on it.

COLD as ICE and TWICE as NICE.. Mr. ICECOLD BIG APPLE TREES says.. It don't mean a THING if you ain't got that SWING!!!!!!!

Then it isn't running in class C. Class C by definition means the device
conducts over less than 180 degrees of the cycle. If the carrier bias
the device on, then it is no longer class C.

OK professor, on AM tell me just how a class c amp, which conducts over
less that 180 degrees of the cycle because they are biased beyond
cutoff, can you get a faithful reproduction of the audio portion of the
signal. If the amp is truly in class C mode, then you will loose more
than half of the audio portion of the signal. The part of the audio
signal when the amp is not conducting will be lost. Don't give me the
bit about the
flywheel effect of the tank circuit reconstructing the audio, it can't.
They work fine for FM because FM does not depend upon amplititude
variations, but frequency variations.

> > >rise and fall times.

It can't clean up the distrotion of the audio. THERE IS NOT ENOUGH
INDUCTANCE AND CAPACITANCE IN THE TANK CIRCUIT TO HAVE ANY "FLYWHEEL"
EFFECT ON THE AUDIO FREQUENCIES. And even if there were, think of
this. The RF carrier is a sine wave (symetrical). If you were shown the
upper half of a sine wave and were asked to reconstuct it, you can very
easily do so because it is symetrical so you just duplicate the
upper half. The flywheel effect in the tank circuit does just this. But
audio is a complex waveform. If I show you the upper half of an audio
waveform and then ask you to reconstruct the bottom half you can't
because it is not symetrical, so you have no idea what the bottom
portion looked like. In a class C amp over half of the audio is lost
during the time the amp is not conducting, so that part of the audio is
lost and connot be reconstructed. If you are getting undistorted audio
out of a class "C" amp, it isn't running in class C mode.

> carrier.

And distortion with AM as well, after all SSB is also and AM signal. If
you claim that the carrier of the AM signal shifts the bias point so you
get out a clean signal, then the amp is not operating in class C, the
carrier is rebiasing it to another class.

Analog S meters are crap. You cant even count on them go back to the same spot every time by appling a known signal from a signal generator much less a signal picked up through the air with extrenuous signals from god knows where and a continuously changing noise floor.. Jeez and you say I am full of it.
You cant' even see the difference by monitring the AGC line of a rx with a differrential voltmeter much less tell a difference by monitoring it on a S meter. The Cu vs Stainless Steel argument has been going on for a long time. I got first involved with it in '72 and have revisited it many times as my availability to better test equipment improved. About 2 years ago I revisted the issue again as a result of a discussion on this NG. At this time I had access to a HP network analyser, still could not get any clearly definable result. Not even an indication that one was better than the other to some unmeasurable or inconsistent degree although that common sense says there should be. If you could see a difference on a S meter then something was FUBAR with your SS whip, you were seeing what you wanted to see or you are lying out your ass about all of this. The math says the difference in these antennas is in the thousandsth of a db range. I can't really confirm this with measurements because I have never had anything that will accuratelly measure any differences that small (hundredths of a db is the best I could do). You say you can see it on an S meter. To this I give a hardy Bronx Cheer.

Prof, you are full of it to your earlobes. Rather than go thru it all again, there is NO, repeat NO way any amp drawing on less than half a cycle is linear. It may be linear enough when what is really being run is a bastard Class B which is exactly what you are doing. In this case you may expect Class B efficiency with Class B heat.

You are playing semantic games with yourself and us in the process. Yes, in a semantic sense Class C is 179 degrees. To anyone with any sense it is about 120-140 degrees with examples down to 60. They are largely self-biased via a grid-leak with only protective bias applied if needed by any direct means. Your use of the 0.7volt forward barrier of a bi-polar transistor is dictionary Class C only; no tech manual would bother with it because, as Young Frankenstein put it, it's doodoo. It is simply slightly overbiased Class B.

Your belief in the flywheel or flyback effect of a tank is right up there with Linus and the Great Pumpkin. It doesn't happen that way. Putting a 100 hz tone on a carrier and feeding it thru a proper Class C amp would result in the modulation keying the amp and producing a sound like an infuriated electric razor. Linear my pretty pink tushie.

Now you will more than likely tell me about AM transmitters using Class C finals and you would be correct. What you forget is that the modulation is APPLIED to the final, not contained in the driving signal. The finals do not amplify a modulated signal because they can't. Because FM uses steady levels, linearity is not an issue.

If you paid some attention to matching and levels in the tank you are one up on most of the bozos building amps down at the local bodyshop. But if they got the same level of technical understanding I see here so far, I have to seriously question whether any such amp exists.

: Basically it was beat by a thicker or more conductive full length whip
: or it was beat by a mildly loaded Ugly Ass type antenna that is also
: more conductive than SS The results DO NOT lie. If you really
: are interested in the truth ten you should run your own test.

If that is true, then it was something besides the fact that the whip
was made out of SS that was the cause.

I have been employed for many years where my job has been designing and
installing transmission lines/antennas.

Would you like the simplest example to show that a more conductive antenna
gains nothing? Look at commercial antennas (where they are trying to get
as great a gain as possible - and cost in no barrier). You will see that
all the antennas are made out of aluminum. No copper, no silver, no gold
plating. They could be made out of stainless steel, but it is much harder
to work than aluminum - and is heavier. Otherwise, it would be chosen.

The DC resistance difference is negligible - and even unmeasurable on
consumer equipment. And the DC resistance of a small fraction of an ohm
is only a minute part of the losses in an antenna. The unavoidable ground
losses (which you don't want) are orders of magnitude higher.

: because of the lack of carrier.

They are excellent for FM or PM. They are NOT excellent for AM - unless
they are "plate modulated".

The lack of a carrier has nothing to do with it.

Aluminum, a strong light weight choice of material has 65% the
conductivity of copper. The conductivity of SS is only 3% of copper.
The testing S meters do not give and explanation why, but they do not
lie. A more conductive full 1/4 wave whips will beat the SS whip.
What's the difference? Only copper compared to SS!!!!!

If you can't by ear get within 30hzthen you have a hearing problem.
Most people don't. The harmonics of a human voice can guide
you. You do not even have to know the individual. Just listen to the
odd harmonics produced when you are off frequency.

I saw what the S-meter saw. It was remotely video taped and repeated
many times A,B,C.....A,B,C.....A,B,C.....
The A always beat the B. The B always beat the C every time.

If you don't want to believe it then that's your problem. I and others
who have actually spent the time and money to do these test know they
don't lie. What we do know is there are a lot of people like yourself
that don't believe, but they have never bothered to run a test either.

>
> > A 'Class C linear' is an oxymoron.

Linear only as far as the RF portion of the signal, not enough inductance and capacitance in the output tank circuit to have any effect on the audio portion of the signal. And the RF part of the signal is a symetrical waveform (sine wave), easy for the tank circuit to reconstruct the missing part. Audio is a complex waveform, the tank circuit would not know how to reconstruct the missing portion even if it could.

Good for AM only if you are going to apply modulation to the final stage (high-level). Feeding in an AM signal into a class C amp only gives you distortion in the output. Remember, if it is truly class C, the amp will conduct over less than half of the cycle, which means you loose over half the audio information. The "ringing" of the tank circuit does not restore the audio. See previous post.

I've done the test and the RESULTS LIE A LOT. Especially when the test have not
been done properly.
Anyone that has really done the test knows that you can't discern the
differences using a receiver, they are too damn close. These types of
measurements require lab quality calibrated field strength meters or power
meters capable of discerning at least 10ths of a db difference in level
preferably hundredths and even then the results of the test can be very non
conclusive. I've done the test between a SS whip and a 3/4inch copper 1/4 wl
antenna dozens of times. The best I could do was say that on a particular day
one antenna appeared to win out over the other more than half the time on

another day the conditions were reversed. While I do agree that the SS antena should have slightly more loss than the copper antenna I could not conclusively measure the difference(perform a real world test). I also now know that to do this type of test would require an anechoic chamber large enough to place the the two antennas envolved in each others far field. Not very practical given the distances required for 11meters. At best this measurement can only be performed at UHF or microwave frequencies and the data extrapolated for 11meters. I know of no one who has done this. But I do know from this that anyone who claims they can tell a difference either ran some poorly controlled test and belived some erroneous readings like I did the first time I tried it or is just blowing a lot of blarney.I sincerely choose to believe it is the former and not the latter as I do not believe you are an intentional BSer..

This all reminds me of July, 1993, when I was headed through South Dakota on the way back home to Montana... I was pulled over for speeding. Yep, I admit - I was speeding. But the cop asked if he could search my vehicle. I knew this would be an inconvenience to me and my traveling companions, but I also knew I had nothing to hide. So, in a way, I was proud that I had no drugs or weapons, so I said, "Sure, feel free to search the car." He did, every last film canister even, and found nothing... except a baseball bat.

Officer: "What's the bat for, son?"

Me: "It's for playing baseball sir."

Officer: "Oh."

Funny, but the point was, I was completely willing to let 'em search the car, because I knew my nose was clean. Of course, I got a ticket for speeding, but that was my only crime. Oh well. I wouldn't trust the cops in Louisiana though; they're just plain assholes.

2337. Mag Mounts - Why do they not use an electromagnet ?

Newsgroup: rec.radio.cb
Date: 2000-05-17 00:00:00 UTC
From: Richard Smith <rsmith@planeteer.com>
Message-ID: <fxxU4.41733$Xk2.149271@tor-nn1.netcom.ca>
Source record: 36110

Just out of curiosity, anybody know why there isn't a mag mount design that uses an electromagnet instead of a permanent magnet? Would it induce noise in the signal ? It sure would allow for easy removal of the antenna (just switch off the power). A low power permanent magnet could be incorporated just to hold the antenna in place when the car power is not running. The power routed to the antenna to run the electromagnet could also be used to run a signal pre-amp in the antenna base.

Richard.
(c) R.Smith May 17, 2000 (Just in case!!)

2338. K-40 vs. Wilson 1000 - Which is better ?

Newsgroup: rec.radio.cb

You wasted a lot of time and money if you actually did the test just like I wasted mine. I wasted mine because I only confirmed to a ridiculous degree that which I already knew. Doing the test was about as dumb as trying to confirm OHMS LAW, everybody knows it works. You wasted yours in search of knowledge you were not sure of and through bad test techniques got some bad data. Frankly at this point I doubt if you did the test at all. You have brought up the point a few times how SS is only 3 percent as conductive as CU. I invite you to show how much loss this actually represents in a SS antenna compared to a copper antenna. If you can't do it then please shut the hell up.

Richard,
Sure, you could do that. It would cost more (copper for coils, iron for cores, etc), maybe two or three times as much. It would introduce a great new parth for noise. The magnetic fields would definitely require adjustment of the fairly standard loading coil at the base of the antenna.
As for the pre-amp idea, I personally don't think it's very good. If your receiver is designed properly, the only thing a pre-amp does is decrease the signal to noise ratio (bad). I have yet to see a pre-amp that was worth having. If you could increase the signal and decrease the noise, it would be great. But that just isn't what a pre-amp does.

That's why I mentionad having a small permanent magnet to hold it on when
the car is not running.

Richard.

I don't know why he calls himself "professor" on this group, he
certainly dosen't understand the theory of different classes of
amplifiers. He may be professor of something, but is certainly isn't
radio therory. You should take the above advice on the ARRL handbook,
you might learn something.

> amp...
>

And by being modulated in amplititude at an audio rate places an audio component on the RF waveform. It is an RF wave that contains an audio component. Yes the RF wave is cleaned up by the tank circuit but the audio component is not and cannot be reconstructed by the tank circuit. What do you think it is after it goes through the detector in the receiver? What do you think is being amplified in the audio portion of the receiver? It is audio, the RF component is removed by the detector and what you have left is the audio component. I repeat, the tank circuit cannot reconstruct the audio component as it is a complex waveform and the tank circuit does not have enough inductance and capacitance to have any "flywheel" effect at audio frequencies, which are present in the modulated waveform. Since a class C amp conducts over less that one-half of the cycle, (120-150 degrees) you loose over half of the audio component and it cannot be recovered, PERIOD. You need to study radio theory. Your don't even understand what happens when you modulate an RF waveform with audio. I suggest you get an ARRL handbook and read up on what frequencies are produced when you modulate a carrier with audio and you will find that there are audio frequencies in the sidebands. How many hams do you know that try to push a modulated RF waveform through a class C amp? None, they know it produces distortion and class C is used for FM, CW or high level plate modulation, not to amplify a modulated carrier. This is from the ARRL hand book concerning class C RF amplifiers, read it carefully. "An operating angle of less than 180 degrees obviously would lead to distortion, because there is no way for the tube to reproduce even a half-cycle of the signal on its grid. Using two tubes in push-pull would not overcome distortion; it would merely put together two distorted half-cycles. An operating angle of less than 180 degrees therefore cannot be used if distorionless output is wanted." Now, tell me the engineer, the real "professor" who wrote that dosen't know what he is talking about.

Exactly, if you don't like the way the other stations sound, use the RIT
and tune the other stations in to you liking, and leave your transmit
frequency alone so everyone else dosen't have to follow you around.

dave
i am not saying that an amp does not amplify.what i was saying is that palomar designed some of there amps(tube device that takes a small signal in and makes it a larger signal out)with circuitry that requires the manual for setting it up after changing tubes or servicing.

Funny...I heard that the FCC is requiring (or will be very soon) your social security number now along with your ham application. If this is true, I would be very interested in opinions on why this has been implemented. What does the social have to do with radio? Appears the feds are violating what the number was intended for....it was never intended as a way of identification. To the best of my knowledge, it is still illegal to require a social strictly for identification, but we, as Americans, have become so complacent in our ways that we now accept as standard practice the "dumbing down" of privacy and we toss that number around to most who inquire and think nothing of it. Nothing to fear but fear itself eh?
And yes, I agree that Louisiana cops are bad. I have learned "to just say no" when pulled over and asked permission to search my vehicle. Why? "If I am not breaking any laws, why fear being searched?" seems to be the prevailing state of mind so far in this thread. And therein lies my answer. I am not breaking any laws so why SHOULD you search my vehicle? Nothing good can come of it. You are delayed (your loss of time, and money in some cases) under suspicion immediately, (guilty until proven innocent, otherwise why would they have stopped you and asked to conduct a search?) and treated as such until said law enforcers are pacified. The sheriffs department in my area continually have dui roadblocks and every 4th or 5th automobile is flagged for detainment at these sites. When the wife and kids are in the truck, they usually stick their head in the window and see if they can obtain a whiff of alcohol. When they notice nothing out of the ordinary (whatever that means to them) without even checking license or registration, usually send me on my way. When I am alone, it is the same story..out of the vehicle, license and registration, where am I headed, whats with all the radio gear, any weapons in vehicle, permission to search, etc. I carry a LEGAL firearm in my truck and everytime I have made the officer aware of it, he immediately goes into psycho-commando-mode, with detainment taking even longer. I know damn good and well all the crimes in my area aren't solved and too many go unsolved. It is a travesty that law enforcers create situations and dilemmas for John Q. Citizen that slowly erode our rights and folks make it ok with themselves rather than concentrate law enforcement resources toward actual productive duties that achieve results.

Those who would sacrifice a bit of freedom for security deserve neither freedom or security.

Yeah, I've got the same box on mine. I've taken the cover off the radio
and looked around for anything obvious (i.e. a loose wire) but I was unable
to get anywhere with that. The thing that puzzles me is that when I tap on
the radio, it'll come back to life (making me think it's a mechanical
issue), but the longer the radio has been turned on (the wamer the circuits
get?) the less that works, until it finally just stays dead. Given enough
time off, though, it's always come back. *shrug*

hey modsquad its cool man , don't worry about it, i just get out here
and cut up. most people know that by now. i think you guys out in the
mini grass state are doing your thing and i was just messing with you.
i am sure you know that. anyway, i still can't figure out how you are
getting 4000 watts out of a 8 pill on a stock alternator though. take
care , old uncle cd is back quiet.................

Dave,
It's just the nature of the beast, a pre-amp is an amplifier that can not discriminate between a desired signal and an undesired signal (noise). Sure, it will increase the level of the desired signal, but it also increases the 'noise' at the same time, and the same amount... no increase in s/n level.
You can increase the signal and not the noise with a DSP filter, but that's not a pre-amp. by the way, the DSP filters use algorithms to distinguish between 'voice' signals and noise. A very large part of the 'noise' we hear is from other people transmitting on the same channel as the one signal we want to hear. Those other people talking are identified as a 'voice' signal by a DSP and so they are not eliminated. DSP's don't get rid of 'voice' interference/noise. We're back where we started.....

I have a confession to make... I tore the tag off of my
mattress, and I am now waiting for the 'Mattress Police'
to knock on my door. I have moved most of the furniture
so that it blocks the front and back doors, spent $375 for
plyboard to nail on the inside of all my windows. I have
cut a trap door in the bedroom floor, from which I crawl
out weekly to buy groceries on Fridays. I no longer
accept phone calls, or receive mail. While not a member
of the NRA, I have purchased several firearms, and have
them placed stratigically throughout my house.
With this in mind, do you think I should give up 'boot-
legging' on 40 meters?

CD I dont have a stock alternater never said that. I got one and it's a
270 amp that runs everything thats why I got 12 vt. batteries Dave Made
regulator set at 14.50 vt. Cd do believe that out of [20] Dave Made or any
maker one would do a whole lot more than the other [19] I think thats the
one I got just my luck. Aloha

My comments within this thread are based on real happenings not only instigated upon myself but other happenings not concerning me that I have real knowledge of. I will not go into detail.

If you are so naive as to believe no injustice could be thrown upon any random law abiding citizen then that's your problem. It happens (rarely) whether you believe it or not.

If you are so willing to let Big Brother have easier access into your life more so than it already is, then you should make copies of your keys and give them to the police so that they can better keep track of your welfare. While your at it give them the right to monitor your activities with video cameras. After all you're not doing anything wrong. So bend over. They would never try anything.

No... the carrier is not re-biasing and changing the class of the amp.
Biasing is a steady-state no signal condition. It's still the same
class no matter how you slice it. It's merely the vehicle used to turn
the device on.

I did the ultimate. No matter how smart you think you are you can not
simulate with math or modeling programs how extremely similar antennas
compare. There is only one way. An actual field test. You have not
done this. So.....

"If you can't do it then please shut the hell up."

Tell me, if your so smart, how would you run an accurate consumer
operated test that removes as many variables as possible, and
simulates real world conditions.

I won't go into detail other than to say I had a legally owned and
operated radio that was confiscated. Shortly after the confiscation I
proved that I had done nothing wrong. It didn't matter. The party
involved was unwilling to admit that they were wrong. They were
even lying in order to cover their ass. I was forced to start legal
action. At that time they capitulated. All the way up to that point
I was threatened by phone with fines and verbally bullied.

Hi
I have run into this problem in this N/H a few times now.
There are so many variables out there many have different
experiences and to some narrow minded people _their_
experience is written in stone as the one and only truth.

I seriously DO NOT doubt your experiments a single bit!!!!

Nothing is built perfect and no one takes into account the +
or - factor in the equipment, which can add up fast.

IMHO you are all right when the +or- factor is considered.

I have found the basic discussion interesting (except for
the incisive temper in some). I take these as "tech tips"
because I may run into a situation I thought was
impossible.... it will not be the first time.

Cheers,
John

You really can't strictly go by the manufactures claims. 58%
under what conditions? No antenna will operate the same in
different installations and /or locations.
Cheers,
John

Your best bet is to ask owners and hear for yourself.
Cheers,
John

DC resistance on a antenna does not mean squat when trying
to figure our RF resistance. RF resistance goes dramatically
with frequency. You guys are arguing over two different
types of resistive conditions!!!!!

And BTW the rude remarks are NOT NECESSARY.
Cheers,
John

If a law abiding citizen does not have the right to do a thing because of a law, reg, rule, ect. Even with ability, he may not do that thing. IE: build a amp.
On the other hand without restriction, any one, may do anything, haveing only need to aquire the ability.

All the ability in the world means nothing if you do not have the right to use it.
.

I do nothing illegal. Period! Never been arrested. Period! Do I have something to worry about? Yes! As do you to. Wake up. People who do no wrong are abused by our goverment every day. Last year alone in Indy, the city had to pay out over $450,000 in law suits because several allege police abuses. 6 mouths ago in a little town north of Indy, a land owner was force to sell 20 acres to the city for socers feilds. In another town they are considering a force destruction of a 5 year old 3 story building because the new zoneing laws forbid anything over 2 stories.

Really I shouldn't have used the word bias in my statement. I should have said "turn the device on". Remember that the bias is a steady-state no signal condition.

The fact is that you don't have to reconstruct the audio. As far as the amp knows... there really is no audio! The RF carrier is changing size (amplitude) at an audio rate. This is not the same as amplifying a pure audio signal...

Check out the Cobra 148GTL with the EXPO KIT installed. This radio is super clean and a loud talker. Frequency coverage is from 26.515 to 27.855 These radios are getting harder to find in this condition and are far more better than the ST models that are out on the market now days. Don't miss this auction!! Just click on the link below.....

2418. Re: K-40 vs. Wilson 1000 - Which is better ?

Newsgroup: rec.radio.cb
Date: 2000-05-17 00:00:00 UTC
From: Jay in the Mojave <jay123a@qnet.com>
Message-ID: <3922F65A.B4F778D9@qnet.com>
Source record: 36191

Hello Richard: I have replied below:

Richard Smith wrote:
>
> Is the Wilson marketing hype correct in stating that the Wilson 1000 has
> 58% more gain than a K-40 (on channel 40) ?

Wilson states that they have a lower loss impedance matching device. And
that the material in the base of the K40 has more dielectric loss than
the material Wilson is using. And Wilson uses a silver plated (I think)
10 gauge wire, to reduce the loss's. And the coil is mounted differently
that are in the K40 coil assembly.

This does make sense to me. The difference between the two antennas has
to be the impedance matching device. How could there be a difference
between two wires of the same ballpark length.

>Anybody tried both antennas ?

I have, the Wilson is a better antenna in my simple opinion. But I
haven't tried measuring the difference between the two antennas.

The K40 antennas use a coil and a 130 pF capacitor as the impedance
matching device, I have seen a bunch of the capacitors smoked off.

The Lockheed Antenna Test Range at Rye Canon California, measured the
difference between the two antennas. They have all the big dollar
equipment and antenna range engineers to make quick work of measuring
these two antennas. I would believe the test results from Lockheed. Who
in their right mind would pay for such expensive antennas tests with a
defense contractor, if they already didn't know the answer! Would you!

I'd would say the boys at Wilson already knew the differences in the
antennas performance, and used Lockheed as a independent test source. By
the way you don't see anybody else using a independent antenna test
facility for antenna results.

> 58% more gain over what ?

58% gain is real close to 2dB, this is well in line. I have measured
base antennas with basically the same antenna assembly, but different
impedance's matching systems, that measure 2 to 6 dB difference in field
strength at 1 mile away.

> Also, why do they state channel 40 ? How is the difference across the rest of the
channels ?

The loss's in the K40, impedance matching coil would have a little
higher loss at channel 40 as compared to channel 1.

Jay in the Mojave

Even though you're essentially sampling the audio 27.2 million times per second, there is still switching distortion. It will have an unmistakable "class C sound".

That is rubbish. You are not sampling any audio! The audio is changing the carrier size only!
Stop to think about it... when you key your AM cb what does the signal look like that comes out. Well it's nothing more than the carrier frequency changing amplitude at an audio rate. At the receiver side the carrier is detected for these amplitude(size) changes and the audio is recovered. There are no pure audio frequencies being transmitted!

I am a telecommunications engineer, been doing it for about 6 years. I have never done the testing that you are referring to but, when measuring ANY type of signal, you never use an Analog meter of any type if you are trying to get the most accurate reading.

OK then, Star Gun has it all over the 55 as far as quality and machine work, but it is all in the tuning as to what will work better. I have never ran a 55 but I have had several Star Guns and was selling them off of my truck on a regular bases. Right now I have a pair of Dave Mades on top and see no reason to change from them, 1800 forward watts and 9 watts reflect, getting my name called on the bowl but stay mostly on 26835, that is more then I can say for most of the Mud Ducks on here claming to be cutting off radios (must be only doing so in there town) Peewee

I think the performance of these two antennas are very similar. However, my opinion is that the Wilson is much more robust and will consequently last longer.

Who cares who you are.

If you had any common sense you know that a analog meter is perfectly
able to show a trend. Most consumer available digital meters would
never have enough resolution to show anything.

Just FYI
When I was A CATV tech we used a spectrum analyzer worth
$12,000 back in the 80's. We were measuring in the Micro
volts.

The CRTC had strict rules... the noise level and cross mod
had to be extremely los, the Video, color and sound carrier
placement had to be dead on.
Cheers,
John

Hi Jay
Your reasoning sounds OK to me.

I have just switched from the K40 to the Wilson 5000 and
have noticed a remarkable increase in TX and RX but also
noise too in my 92 Cavalier. OTOH I am not saying that some
one else will get the same results... I just consider myself
lucky that the increase was above my expectations. As I said
before I take manufacture hype with a large grain of salt!
Cheers,
John

2443. Simple Minded Non Techie Observations on the Magnum 257

Newsgroup: rec.radio.cb
Date: 2000-05-17 00:00:00 UTC
From: Redwire <graydogsNOgrSPAM@yahoo.com.invalid>
Message-ID: <01229e2a.5735657c@usw-ex0103-086.remarq.com>
Source record: 36316

Not a review. I'm not qualified for that. Just some comments and observations. Take them for what they are worth with the knowledge that I am not a tech. Just a radio user. However someone asked about this radio a while back and no one had used it enough to make comments. I make these observations based on comparison to a 2950 and 2510 and Cobra 148 I also use. All the observations are based on 11 meter use. The 257 I use is one of the early models without "varable power" control.

This sucker is tiny. I do mean small. This is an advantage if you drive one of the small pickups or suv's. It is quite at home in my GMC Sonoma but is totally lost in my large Ram Charger. The body is 6" X 7.5" X 2". The heat sink and controls add to the overall length. It is so small it is hard to use unless you mount it on top of the dash where it is easy to see & read the controls.

The microphone is much to small to be used easily by the average man. Dainty describes it best. It becomes lost in the palm of your hand. It is so small it is hard to use without unintentionally pushing every button on it. It is 2.5" X 1.75" and is so light it will not "lay" in your lap as you drive. The cord will pull it onto the floor. My suggestion is to replace it ASAP. It is a six pin with channel up/down buttons on it which work fine.

Build quality seems to be excellent. The radio looks and feels "rugged" and "tight". Everything fits well and all controls seem to work as they should. The rubber knobs give a good control feel. Much better build than the 2950 and even the 2510. The light rings around the knobs help in the dark.

The front panel is uncluttered with a minimum of knobs and switches. Many of the functions are acheived through software and multi-function buttons (even the tone). The clarifier is "hair trigger". Just a nit this way or that brings big results. Same is true of the RF Gain. This takes some getting used to after the "slopy" feel of the 2950. And again it helps if the radio is on the dash when you make adjustments.
Control layout is good and makes more sense to me than the two other exports. Memory operation is easy to set up and remember. Mode is selected by pushing a button instead of turning a knob. This can make it difficult to know which mode you are in without taking your eyes off the road and looking directly at the radio. And for those of us with "slightly used" eyes even then you

guess whether it says USB or LSB.

Running barefoot my radio is set up to put out 4 on AM and 30 on the Side. I use it with a 4' FireStik II. SWR on channel 38 (for DXing) is 1:2. Barefoot it can't keep up with the 2510 or the 2950. (each of these running 25 on the Side) I can't get it to go the distance, or at least it seems that way. Just seems I make fewer contacts when using it.

Run it through an Amp however and it is a different story. Running it through a Palamar Shooting Star 250 (or is it a 225?) it runs circles around the other two exports running through the same amp. Midway island was jumping in the other day and a fellow DXer patiently maintained contact with me while I tried each radio. Both the 2950 and 2510 made the trip but the 257 got me the best report from him. I also got good reports from American Somoa and Hawaii. the 2510 and 2950 made the same trips but not with as good reports. I was worried about overdriving the Shooting Star since I can't adjust the power down. But all contacts gave me good modulation reports.

It receives very well, and probably has an edge over the other two radios in this department. The sensitive clarifier seems to make it easier to single out one station during a DX pile-up. However an external speaker is a must. The small one it comes with sucks.

Over all with the exception of the small mike and hard to read mode settings I like the radio. But if you don't like small radios you probably will not like this one, although the radio looks and feels "tight" which makes you like it despite its size. I think it is a bit overpriced at $249-269. $199 is more like it.

Just non scientific observations. All the comparisons were made using the same vehicle, same amp., and same antenna. Hope it helps someone.

Hello,
I know general automotive electric wiring, but am not quite sure on installing a two-way radio which would seem very simple. I attempted to install one in a Chrysler fifth Avenue and blew several fuses out. I currently have it my two-way radio all mounted and ready to go in my 1999 Dodge Ram and would like to go ahead and hook it up myself. Would any be able to give me some good information and pointers how to go about this properly. Any information would be greatly appreciated.

Put the blame on the cash drain where it belongs. Each and every citizen of the USA should have guaranteed access to whatever level of health care one may desire. This could indeed have been instituted long ago, but the bureaucrats in DC have been misappropriating funds of massive proportion (foreign aid, useless studies, questionable grants) for decades. I've got news for you, we always will pay for the uninsured, the indigent, etc. In a perfect world, we would not have a problem with that simply because if everyone had adequate medical coverage, the seat belt and helmet and related issues would be a moot point. It is HOW the monies are being manipulated that creates the problem. Not whether or not one chooses to wear a seat belt, helmet, or ride in the back of an open pick-up.

Ben,
It's not as bad as all that. Again, if there were no rules, I promise you NOBODY would be able to use radio. Actually that was the case in the late 20's and 30's. It was bedlam--literally. That was what led to the Communications Act of 1934. Those rules you hate so much and the attending authority to enforce them are actually HELPING you whether you know it or not. It's what separates different radio services from each other, preventing hopeless chaos. Police couldn't respond to robberies because of jammers who think it is funny to do that. Aircraft would collide in midair because there would be no control over who could transmit on the frequencies they were attempting to use. Ambulances would not arrive in time to save the lives of motorists who have wrecked, or victims of heart attack because people could just dial up anywhere they wanted to with whatever amount of power they wanted to, and start talking. Lots of laws, I don't like either, but they are not to impede you, for the most part, but to HELP. Yep, there are stupid laws, but the laws governing the use of radio are not among them. It is a necessary "evil" depending on one's point of view. And if not the FCC, then who and how would you suggest it be done? Would you want your child to DIE because there was a BIG POWER station operating on the ambulance frequency, and they couldn't locate your address because their radio was jammed? I bet you'd be ready to go looking for the culprit and kill him yourself, if there was no one with authority to prevent such or punish those who would jam others' frequencies.

Respectfully,

Jerry

I'm a liar or don't have a clue. Better take a better look at yourself
before you start throwing stones. All I know is that I know that other
antennas can beat the 102 " SS. Even some shorter antennas can.

Now, who is the clueless one?

>recongnise it as such.

My tests are consistent. If antenna A showed an increase over antenna
B then it would be noted. To confirm the slight differences between
these antennas the comparisons were done back to back and over and
over again. The results stayed the same. S- meters although not
calibrated are still very useful as relative indicators. The
indication if there was one, was noted.

>The biggest thing that screwed my test was the varying noise level from being
>in an open environment, How did you overcome this problem? It sent my readings
>all over the place.

You had trouble because you used a non discriminatory field strength
meter, or your signal levels were to low, or you performed the test
during heavy traffic or skip.

>From your response I take it you don't know how to do the calculation or are
>just too lazy too do them.

Or there is no reason.

As I said before several times I am here to help when I can
and learn when I can.

BUT I do not appreciate me posts associated with name
calling and in
other innuendoes.

Is this how we are to represent the CB people of North
America to the world?

No wonder CBer's are the but end of jokes and people are
making life hard for the CBer next door when there is a
little TVI... we are already labeled as trouble makers then.
And if you say I don't care, then what are you going to say
when the FCC starts clamping harder down on CB again.
Personal rights are a two way street.

Remember these posts are archived and read the world over.
How are you going to feel when you meet the guy you just
called a lire on DX and wants to chat until he finds out
your ID?

I enjoy your posts and have learned some things, but I
already know how to take a thick stripe off some one and I
do not enjoy confrontation nor do I run from it. You learn
that fast when you have a heart disability that does not
always show.

This is posted and emailed in the hope to put some class
back in to CB and not to be taken as an offense to anyone.
Cheers,
John, X-Ray 730

Date: 2000-05-18 00:00:00 UTC
From: CodysPC@Iserve.Net
Message-ID: <39233ccf.2925452@news.iserv.net>
Source record: 36202

Greetings!

Or just go around with a 15-20 watt pencil iron and work your way from
the power supply feed thru the traces. It could be a solder joint, or
a "trimmed lead" trimmed too far and the waveflow solder machine
couldn't apply enough solder to the part, or the part moved during the
soldering process and passed inspection, but failed in the real world.

Thinking over what I posted earlier, the power switch
would fail the moment you turned it on. More than likely
it is a solder trace pad on the main board to the front panel
that is causing this problem.

A leaky cap would operate in reverse fashion, or short
altogether and blow a fuse.

Lamps on the front panel heat up - expand the board, and you
have to wait for it to cool off.

Or...

A leaky Zener diode in the main board voltage regulator
circuit has decided to develop a thermal problem.

On Wed, 17 May 2000 14:04:12 PDT, while the modem was pondering it's
navel, Tom Geldner <tom@xor.cc> dissertated the following:

>Cracked circuit board, bad switch or maybe a bad capacitor. As
>things heat up, they spread apart. Try using freeze spray on
>various places until you isolate the problem.
>
>Tom of XOR
>http://www.xor.cc for cool threads

Mod Squad I don't care if you are seeing 4,000 or 400 watts out of that Dave Made 8 pill, all I know is I hear you in VA and I never hear the rest of these Mud Ducks on here that seem to know it all! I run a Dave Made 8 in my truck and use a Dave Bird meter and I see 3600 peak on 16 volts all day long and that is with 1- 200 amp alt.They can use their math until the cows come home and I will send them their lips back UPS when I'm done. see ya! Peewee

Unless you are willing to run a lot off current up there are ceramic magnets ht
are at least as strong as any elctromagnet you would be willing to put up
there. I bought a ceramic manet a couple of years ago that will pinch a blood
blister on your finger if you get your finger between it and a piece of metal.
Get two of the magnets stuck together and you call a buddy to help get them
apart.

You must be kidding, I don't leave my door unlocked because of
freakin' criminals. The feds or local law don't come knocking for no
good reason. Haven't yet. If they do for some unbelievable reason I'll
GLADLY let them in but they better have a damn good story to tell me.
I have nothing to hide so I have no problem letting them in. There is
nothing here for them. NOTHING. They'd leave with their tails dragging
between their legs. Looking like complete morons.

You are one VERY paranoid dude....

Thats exactly what I have been trying to get across. He thinks there is enough differrence in the conductivity of Cu and Stainless Steel that you can actually tell the difference between like constucted antennas made of different materials. He claims he has made the test and can actually see the differences on an S meter. If he did it was not due to differences in the conductivity of the metals. I have tried the test and know that there is just too much stuff to screw a test like this up Notice I never made a claim that I was sucessful with my test, they were dismal ,frustrating inconclusive failures. However I KNOW why they were failures and I KNOW that anyone who claims they can stick a couple of mobiles out in a parking lot and thinks he can tell the difference in the two antennas on an s-meter doesn't have a clue to what they are doing or is just a plain liar and has never tried it at all.

I have never tried to simulate anything, I DID THE TEST so I will keep on talking . Before I did the test though I tried to figure out what kind of results I could expect. All I really found was that I could not come up with a suitable test with the means I had to verify the expected results. I know why my test were inconclusive and I know that if you really did the test the way you said you did your results were inconclusive too although you may not recongnise it as such.

The biggest thing that screwed my test was the varying noise level from being in an open environment, How did you overcome this problem? It sent my readings all over the place.

From your response I take it you don't know how to do the calculation or are just too lazy too do them.

Class C is non-linear by design. It dosen't start conducting until the
input signal level overcomes the bias voltage that is keeping it cut
off, you only get approximately 120-150 degrees of the entire cycle.
That is non-linear.

: I am a telecommunications engineer, been doing it for about 6 years. I have
: never done the testing that you are referring to but, when measuring ANY
: type of signal, you never use an Analog meter of any type if you are trying
: to get the most accurate reading.

To get a proper measurement, you cannot measure at the AGC stage - which is
where the S-meter gets its voltage.

The best place to measure is at the first RF amp - if your equipment is not
sensitive enough to measure the signal at the coax.

: load and then see what he's getting

That may not help. What would help is a couple of line isolators that minimize currents on the outside of the coax. Those currents can make a wattmeter read incorrectly - or, in some cases, more incorrectly than it already is reading.

:> They are excellent for FM or PM. They are NOT excellent for AM - unless
:> they are "plate modulated".

It isn't a "fixation". It simply allows you to use Class C amplifiers
on AM, without distorting the modulated signal. It has been used by
commercial AM stations for at least half a century. The disadvantage
is that it requires a lot of modulation power.

: knows... there really is no audio! The RF carrier is changing size
: (amplitude) at an audio rate. This is not the same as amplifying a pure
: audio signal...

You should know better than to make such a claim.

I have a simple experiment for you. Get yourself an RF spectrum analyzer.
Now feed an AM carrier into it. You will see a single frequency spike at
the transmitting frequency.

Now, modulate the carrier with a 1000 Hz sine wave. You will now see the
same single frequency spike (at the same exact amplitude) for the carrier.
You will also see two other single frequency spikes for the two sidebands.
One will be at the transmit frequency plus 1 kHz and the other at the
transmit frequency minus 1 kHz.

In other words, the modulation does nothing to the carrier. But the
carrier is necessary to convert the audio signal into an rf signal.
The so-called carrier is unchanged.

That is why SSB is so efficient. The carrier and one of the sidebands is
stripped out early in the amplification chain. All you have is useful
modulation.

Not funny at all. While I have no idea if Brian has a real amp, I do know a bit about electronics prototyping. These days, it is relatively inexpensive (and fast) to get a one-off prototype board cut using digital machinery. It is what I would do if I wanted to prototype an rf circuit.

All the job shop needs is a drawing of the trace layouts, as well as the specs on the board - such as trace thickness and width, substrate etc.

: increase the signal and decrease the noise, it would be great.
: But that just isn't what a pre-amp does.
: 'Doc

True, in most cases. However, there are some rare occasions where
both the noise and the signal are below the noise floor of the
receiver. In that case, an amplifier at the antenna can make an
otherwise inaudible signal strong enough to copy.

This would be a very rare situation at 11 meters, where there is a
lot of manmade noise. However, such amplifiers are quite common at
UHF frequencies - especially on repeater systems where the limiting
factor is the weak mobile/portable transmitted signal strength.

Have to disagree. If you measure it at the RF amp then you may and
probably will receive signals from other channels that are not even
part of your test. You must be selective enough to be assured that
your test is concentrating on the desired signal and not some
random signal that could be anywhere in the RF spectrum.

Two rednecks, Bubba and Cooter, decided that they weren't going anywhere in life and thought they should go to college to get ahead. Bubba goes in first,
and the professor advises him to take Math, History, and Logic.

"What's logic?" asked Bubba.

The professor answered, "Let me give you an example. Do you own a weed-eater?"

"I sure do," answered the redneck.

"Then I can assume, using logic, that you have a yard," replied the professor.

"That's real good," the redneck responded in awe.

The professor continued: "Logic will also tell me that since you have a yard,
you also have a house."

Impressed, the redneck shouted, "AMAZIN'!!!!!"

"And since you own a house, logic dictates that you have a wife."

"Betty Mae! This is incredible!" (Bubba is obviously catching on.

"Finally, since you have a wife, logically I can assume that you are heterosexual," said the professor.

"You're absolutely right! Why that's the most fascinatin' thing I ever heard of. I cain't wait to take this here logic class." Bubba, proud of the new world opening up to him, walked back into the hallway where Cooter is still waiting.

"So what classes are ya takin?" he asks.

"Math, History, and Logic," replies Bubba.

"What in tarnation is logic?"

"Let me give you an example. Do ya own a weed-eater?"

"No."

You're gay aren't ya!

I`ve got an Astatic D104 mic that hasn`t seen daylight in 20 years.
It would now be about 25 years old.
It`s kinda ruff looking(used a lot back then)
I think it was around $50.00 new ?????
I don`t know what the rest of the catolog number is or even if there is more to it.
It is chrome, has only the stem keying bar, base is silver/gray if I remember correctly and uses a 9 volt battery for power. (standard crystal lollipop mic ???)

My question is; Should I upgade to a new one if I decide to go with a lollipop mic or stick with this one ???

I also have a blue Turner mike that I think is a Plus 2 ????
I can`t remember where I put the damn thing.
I only used this one a couple of times so it should look brand new if I can find it.
It is also the same vintage.

Any comments or suggestions are greatly appreciated

Absolutely, and if if worked as the so-called professor states, tben
those commercial AM stations would have done it that way as it would
save a tremendous expense of generating all that audio. Imagine how much
cheaper it would be to eleminate the 5,000 modulator to modulate a
10,000 watt signal. So tell us professor, why don't the commercial AM
stations use your method? Did Collins or Contential, two of the largest
builders of commercial AM transmitter ever build such a transmitter,
applying a modulated signal to the input of a class C amplifier? For
your education "professor" the answer is a big NO. Why? Because it
dosen't work.

Holly cow, the output is directly effected by what the device is doing.
Have you ever seen a commercially designed transmitter where an am
signal is applied to the input of a class C amplifier?

> Bill Nelson (billn@peak.org)

Now this "professor" claims that class C is not good for SSB, however if
a class C amp can be use for AM, well, "professor", an SSB signal is AM
also. It is also amplititude modulated, just minus the carrier and one
sideband, and a class C amp cannot distinguish the difference between a
DSB with carrier (normally referred to as AM) vs a SSB signal. So if it
works for one (which it dosen't) it should work for both.

> times...

For the RF part of the wave professor, for the RF part of the wave, there isn't enough Q in the circuit to have any, I repeat ANY effect on the much lower frequency audio component of the signal. And again, the audio component is a complex waveform, if over half of it is lost because of the conduction angle of the amp, please tell me how the tank circuit could possibly know what the lost portion of the complex waveform looks like? For gods sake, get some books and read up on the subject. I have quoted directely from the ARRL manual about how class C amps cannot be used to amplify a modulated signal without distortion and you have yet to answer, are you saying those engineers are wrong? Answer the question. If you are getting distortion free signal out of your amp then I guareentee it isn't running in class C mode. Please answer why commercial stations do not use your design, it would be much more cost effecient, why did not the two largest commercial builders of AM transmitter ever design a transmitter using your method. BECAUSE IS WILL NOT WORK!!!

Explain how the amp can reconstruct the missing 2/3 of a complex waveform. If I show you the upper 1/3 of an audio waveform, can you reconstruct the missing 2/3?

I guess I should take the advice I was once given, "never argue with an idiot...you will loose everytime because they can never recognize when they are wrong."

Then why do not commercial tranmitters use this design. You can't get enough Q in the tank circuit to have any effect on the audio frequencies. And again, and again, and again, the audio is a complex waveform, there is no way to reconstruct the missing part.

That is because you amp isn't really running class C. You cannot put an AM signal in on the grid if a class C amp without getting distortion on the output. Like you say, some have littel experience or electronics knowledge or they would know that. Read any book on class C amp and you will find out.

You may very well have a functioning Class B amp, assuming it exists at all. It may actually be a well-designed Class B amp if the distortion at cut-off can be tolerated. It will produce Class B efficiency with Class B heat.

What you do not have is a device that by any definition save a very narrow one be described as Class C.

Blind pigs find acorns, too.

Ah, so they simply missed that fact huh? If that were true, they why in every technical publication I have they say nothing about that. If that were true don't you think it would be mentioned in some technical publication? If you have that in some technical publication, please tell me which one, I would really like to read it. Don't you think that if that were true, engineers who design transmitters, commercial and amateur, would have used that design long ago? Have you ever seen it claimed anywhere, except on cb, that you can get distortionless output from a class C amp with a AM input signal? Have you ever seen this in use in any commercial service? Or do you claim that this is some new discovery you have made yourself and all those engineers who hold degrees have just missed this fact for all these years? Name me one commercial broadcast transmitter that uses this concept. Believe me, if this worked, it would certainly be in use commercially as you could save a lot of cost by not having to have a lot of audio to modulate a class C amplifier. But it dosen't work and that is why you won't see it anywhere but on the cb band where it is nothing but hype and BS. Those who (including you) who claim distortionless output from class C amps are being duped by the cb con game. If the output is distortion free, then the amp is not running in class C. My amateur AM transmitter incorporates a high-Q tank circuit, in the final class C stage, it has lots of Q, the final tuning is very sharp (which is an indication of high-Q in case you don't know), but it dosen't apply the modulated AM signal to the input of the final. It uses high-level modulation where the audio power is applied in series with the plate circuit of the final. Why? Because the Collins engineers, who were trained as engineers (unlike you professor and forgot more about RF amplifier design than you could ever hope to know), knew that you cannot amplify an AM signal with a class C amplifier without distortion.
So please "professor", tell me of a technical publication that will substaintiate your claim, I really want to read it.

Besides that, all I did was hook the positive directly to the battery,
and the negative to the ground (car body). No big whoop. I get a little
alternator noise, but not enough to complain about.

Hello Steve, are you having much trouble with the X Force base amps. now? The one I had is burned up again. 4th time I know of. It has been send back to X Force 3 times and I guess they can't fix it. Looks like a amp of the price of this one would not be such junk. I am so ashame of selling it to its present owner that I hate to even talk to him about it.Now the people at X force will not return a call to the man who has it. He has called several times and left messages for Carl to call him but has not received any calls yet. He asked me if there was a chance that the man at Bulldog amps . might could fix it. Just wanted to let you know about the progress of this amp. Its a piece of crap. and would make a good boat anchor. Have a good day, Dennis.

According to what I believe, God's law supercedes man's law IF man's law is different than man's law. The Bible says to "obey the laws of the land," unless, or course, they directly contradict God's law. But man's law suddenly says we have to worship Buddha, then I'm going to jail. But please find me someone to whom God has told to transmit illegally on any radio frequency. "And lo, go forth and broadcast a thousand watts on the eleven meter band."

But the point of Christianity is not a bunch of rules. It's generally about treating others the way you'd like to be treated, realizing that we're all sinners, and that there's a way to fix it. If you disagree w/ me, that's your right as an American and as a human. (Sorry, I didn't mean to start preaching...)

I'm getting your point! You are saying that you are among the minority of Americans who hasn't figured out that certain behaviors, such as riding in the back of a pickup truck or driving without being belted in, are not in your best interest. Here's the deal: Judging from your comments, you probably don't have any auto insurance, so you crack up, and because you aren't belted in, you go flying and suffer cranial injury, are carted to the county hospital where you get FREE treatment--well not exactly free, because the rest of us had to pay for your idiocy. The reason the government has to enact such silly laws such as the seat belt requirement is because some morons in this society just don't get it, and the rest of us are sick and tired of supporting them. The law isn't there to protect you. It's there to protect ME from YOU! You would be the first guy on the block to gripe about welfare, but the first one to collect it if you did something stupid and got hurt doing it.

Greetings!

You're asking the Base region to be linear. It's not adaquate. I'm not saying it can't be done. But when looking for high-gain designs, the collector plays a major role in how the base region responds to a drive signal.

It's an inherent problem when making class C devices. The demand is on the base region as the sole means to provide some linearity without control of the collector current, open gain = non-linear response. The Base region would want to follow the collectors own steady state DC instead of operating linear.

Applying audio drive to the collector provides a means to provide some linearity for the base/collector current.

The effects of audio-drive would reduce the non-linearity problem associated with class C amps. Even the addition of negative feedback would allow the collectors own seady-state DC supply to modify at the base region - allowing for more linearity at the sacrifice of open loop gain.

The basic CB is a class-AB [SSB] or class C [AM/FM] design, only using audio to modify the collector current which improves the linearity.

And also maintains some control of the impedance values present in the circuit. At least to provide some linearity, the wide range of impedance values Class C amps present, needs to be limited - but not excessively.

And in the case of class C the devices do not conduct until the signal
reaches a level to overcome the bias and turn them on which is on the
upper 120-150 degrees of the signal. The rest of the signal is lost.

Professor, listen, the RF waveform contains audio frequencies, if you chop of 2/3 of the wave form you have also lost 2/3 of the audio as well. The amp cannot reconstruct it. Read the damm books and learn about different class of amps. They will tell you if you try to amplify a modulated signal with class C you will get a distorted output. Or do you simply state all those engineers who design such amps and write in those books are just stupid and wrong.

Because in plate modulation the audio is applied in series with the
current supply of the final RF amplifier. Thus you are modulating the RF
at the output of the tube where the RF has already been restored by the
tank circuit. You obviously understand nothing about amplifier theory.

Here is is again, directly from the ARRL Handbook, "An operating angle
of less than 180 degrees obviously would lead to distortion, because
there is no way for the tube to reproduce even a half-cycle of the
signal on its grid. Using two tubes in push-pull would not overcome
distortion; it would merely put together two distorted half-cycles. An
operating angle of less than 180 degrees therefore cannot be used if
distorionless
output is wanted."

Read it again carefully, it is saying you cannot amplify a modulated
signal with a class C amp without distortion. Are you going to say now
that this is all incorrect, that the person who wrote this dosen't know
what he is talking about? That all those RF design engineers are simply
wrong and you are right? What engineering school did you graduate from
"professor"?

Greetings!

I was referring to filtering, and yes, in regards to the effects, the
main component is RF. Audio has a completely different response in
such a tank circuit.

But, concentrating on the RF side of things, the audio
envelope can easily exceed the base regions saturation point
and work like a digital switch, or "FM-ing" even though the
carrier can work somewhat linearly, and quite faithfully.

It's the varying audio envelope that goofs up the design.

On Tue, 16 May 2000 19:12:37 -0500, while the modem was pondering it's

First of all I do wear a belt. I do have insurance. And if I didn't, I don't deserve free health care. If every one had to pay there own way, you and I wouldn't need to. Passing public safety laws does not solve this problem. It only takes our freedom away.

2573. Re: class c amps ? b amps ?

Greetings!

And you are correct.

One small problem with Class C designs, is the change of power present
in the circuit when carrier is changed in power at an audio rate. The
power levels can force the amp into non-linear operation when audio
drive is higher than the carrier level to the extent that when the amp
attempts to drive the signal at the collector, theres no more room.

This doesn't occur with the negative modulation [except for cutoff]
but positive modulation can make the design go too far into conduction
and saturate.

On Wed, 17 May 2000 18:17:50 -0500, while the modem was pondering it's
navel, "Professor" <bgriffey@kwom.com> dissertated the following:

>That is rubbish. You are not sampling any audio! The audio is changing the
>carrier size only!
>Stop to think about it... when you key your AM cb what does the signal look
>like that comes out. Well it's nothing more than the carrier frequency
>changing amplitude at an audio rate. At the receiver side the carrier is
>detected for these amplitude(size) changes and the audio is recovered. There
>are no pure audio frequencies being transmitted!

2582. Tech's worst enemy?

Newsgroup: rec.radio.cb
Date: 2000-05-18 00:00:00 UTC
From: mickey <mickeyNOmiSPAM@mickeys.co.uk.invalid>
Message-ID: <13e04bc0.15ebdbb1@usw-ex0105-037.remarq.com>
Source record: 36355

Many years ago I bought an old Cobra 148, and had it had converted by a chap in the UK. The rig covered 26-30 MHz. He also installed a six-digit readout, (which was box office stuff at the time) and the rig itself performed superbly well. However, one small problem was that the rig ran very hot, although this did not seem to affect its performance.

I must say I still miss it.

I think that I would be fair to say that *heat* is the techs worst enemy.

This may sound silly, but has anyone built or modified a mobile rig that needed some sort of cooling other than a heat sink?

Theres not much space to play with inside a mobile rig, so I imagine it to be a real challenge.

I remember my old 486 PC didnt have a fan, but my P3 would soon shut down without one.

Thanks for your time.
Cheers Mickey

I finally bit the bullet and purchased a Galaxy 55V from an online dealer and received my radio today. Now my only problem is - where can I get a list of the frequencies that will tell me what channel I am on, i.e., the "low side of 19"? There was nothing in the owner's manual paperwork that would give me a clue as to how to figure out what channel I am on when switching bands.

My point is:

Stock CB radios do not give the operator the ability to
move there transmit.

Stock 10 meter radios can have the ability to move
the transmit, but unless you have the ability to tie this control
to the receiver then you can only move your transmit blindly.

If you can only move your transmit blindly you then must
depend on someone else to guide you.

If you have to depend on someone else guiding you then
you are doing something wrong.

P.S. I have no problem with RIT. But is has to be secondary
to a method of guiding your own TX, (TX=RX)

HyGain IV 40 channel base, PLL02a chassis, very modifiable, works great, looks scruffy, will include a hand mike that will need to be wired for it. (came w/Turner +3 for sale in another ad) $35

VERY nice TRC449 Realistic 40 ch AM/SSB mobile, same rig as the 138XLR Cobra, 858 PLL chip which is very modifiable, radio is completely stock and never screwdrivered up, w/mounting bracket, stock mike and I'll throw in a power mike with the deal (will need a battery) for $100. Much nicer radio than what Cobra is pasing off for the 148 nowadays......

Royce 641 40 ch. AM/SSB base, decent condition, front panel not all fouled up, some scratches on the side wood panels, big impressive base, no mods, keys to 5 W but no mike to test SSB output. Can be modified for channels and bigger output. $75

all sold as is, plus shipping, ppd. MO only, email replies please.

Sorry, it is 10 meter only. Rat Shack got in dutch over the HTX-100
a few years back because it would mod for 11 meters, and they had to
correct that to get the new one FCC certified.

Hello Steve, are you having much trouble with the X Force base amps. now? The one I had is burned up again. 4th time I know of. It has been send back to X Force 3 times and I guess they can't fix it. Looks like a amp of the price of this one would not be such junk. I am so ashame of selling it to its present owner that I hate to even talk to him about it.Now the people at X force will not return a call to the man who has it. He has called several times and left messages for Carl to call him but has not received any calls yet. He asked me if there was a chance that the man at Bulldog amps . might could fix it. Just wanted to let you know about the progress of this amp. Its a piece of crap. and would make a good boat anchor. Have a good day, Dennis.

Message-ID: <3924633B.5804F0F6@home.com>
Source record: 36371

.....and if folks using CB subscribed to this philosophy, the 40 channels would be worth trying to use. Seems though that a lot of guys on this newsgroup see the ten commandments merely as suggestions in a cafeteria line and choose to overlook a few. Forget the FCC for the moment; who can justify using monster power to be the 'channel master' to the detriment of all other users?

2599. WTB:Moble CB -controls on Mic

Newsgroup: rec.radio.cb
Date: 2000-05-18 00:00:00 UTC
From: mcyclemem@pipeline.com
Message-ID: <8g1opr$cu0$1@slb0.atl.mindspring.net>
Source record: 36372

I'm looking for a working CB that has the controls on the mic. -
Remote. Would like to find something similiar to Maxon's remote or
Cobra. Needs to be cheap but work because it will undergo experimental
surgery. I am looking at the possiblity of adapting this sort of CB
to use on a Motorcycle. Idea is to mount the mike but have jacks for
speaker/mic to use in helmet. Then a jack for remote push to talk that
would mount to or near the handgrip. If anybody has worked on this
kind of thing - your input will be appreciated.

Thanks
Dale

From: Gary Danaher <gdanaher@home.com>
Message-ID: <392465AF.8A768994@home.com>
Source record: 36374

Connect the radio directly to the car's battery using wire which will tolerate the heat of the engine compartment. The wire size whould be more than adequate to handle the amperage draw of tghe radio at full output. This might be 16 gauge or larger. Normally many stereo shops have a red and black zip-type wire well suited for this. You need to be certain that you maintain polarity between positive and negative. Solder all connections and as a minimum, fuse the positive wire. I prefer to fuse both positive and negative as a fail safe. Under no circumstances should you elect to wire through the fuse panel of the vehicle. This will result in excess noise and you will be writing additional questions asking how to eliminate the noise, so, just do it right the first time!!

mickey,
Your right, heat is an enemy of techs, designers, and users,
unless you live in the arctic. Lots of the new radios that were
designed to run a little power have a built in fan, in addition
to the heatsink. Some might even have a 'peltier junction' to
cool the 'hot spots'.

It will work for SSB... but you will hear a slight audio distortion at the beginning of a spoken word due to the carrier rising and turning the device on. Really, most people who aren't trained to listen for this would never even know... but it is detectable. This phenomenon does not occur on AM so long as the carrier is high enough to turn the device on. On FM... if your carrier was too low... and since there are no amplitude changes... the device would never come on. But raise the drive level to an acceptable level (turn on) and it also works like a million bucks.

> Now this "professor" claims that class C is not good for SSB, however if

do we have to go over this again for your people ..... the antenna system is just as important as the amp . a 1/2 assed amp with a great antenna system will win over a good amp on a 1/2 assed antenna .

and since when is a key down a measure of how good an amp is . wouldn't the person that has had one for years without having to fix it be that measure .

keydowns are no measre of long term quality or sound / audio quality . as a matter of fact most comp amp are barely intelligable when it comes to audio .

Now put your anger aside and think about this carefully...
The point is that I claim the amp is not amplifying audio frequencies
anyway!
The carrier frequency is changing amplitude at an audio rate.
There is a BIG difference!

Professor, you have't read or understood a word I have been saying. I
have agreed many times that the tank circuit can restore the sine wave
(the RF carrier portion of the signal) so yes, you can and will get a
good sine wave out of the tank circuit, but it will not and can not
restore the audio portion of the modulated waveform which is a complex
waveform that is riding on the carrier.

Your full of it. The tell me, why do hams not use class C for SSB?. Why
are all amateur amplifiers for SSB operated in a linear class and not
class C? Why do commercial transmitters not use class C for SSB? When
you apply enough carrier to the input to the amp to turn the device on
by overcoming the cutoff bias, it still is only on during less than half
of the cycle if it is truly class C. I have ask you and you have yet to
answer, please show me a technical publication that supports what you
say. Can you?

On FM the carrier is too low? The device will never turn on? So your
stating on AM that a class C amp has no output? Does the carrier
level change with modulation on AM?

That's exactly what the post was about! Since you have a good sine wave...
and the sine wave is changing size (at an audio rate)... then what in the
world is the problem? The sine wave is the only thing being amplified as far
as the amp knows!

My class C amp? You have nothing more than a cheezed out class B amp.
Its not a class C amp, other than the .7 volts turn on. Your amp has
none of the attributes of a class C amp, so quit calling it one. If
you really want to prove that a true class C amp will amplify AM with
no distortion, bias your cheezed amp to 120 degrees of conduction and
see what it sounds like. Then come back and tell everyone how great
an amp a class C is for AM.

I think you pretty much hit it on the head with the arguing thing. He already admitted if his amp had another transistor and was running push pull he have a class B push pull with cross over distortion. Take away a transistor and nows it class C. Go figure, he needs to run his amp as a true class C and see how well his tank circuit reconstructs the complex audio waveform. He really does not understand what a true class C amp is.

Ok, this might be a stupid statement, but then couldn't you use a DSP filter
and then after it, use something that would cut the signal below a certain
strength level, (similar to what a squelch does). Now granted It would
slightly defeat the purpose (the purpose being to boost the receive signal)
but I think it might be interesting for someone to test the theory out?
Does this make any sense or has this idea been done before and failed?

Just a simple question to start with. Do you actually think about what you say before you say it? Apparently not. Have you ever even used any type of digital meter? Didn't think so. Any piece of digital equipment is far more precise and accurate than any piece of analog equipment. If an analog meter would show a change, I guarantee you a digital will also. Unless of course you don't how to use the equipment in the first place. That must be your problem.

This is a quote from the book written by Robert Schrader named Electronic Communication. This is taken from the Amplitude Modulation chapter on page 378:

"It is important to understand that in single-ended circuits, flywheel action alone is responsible for the reproduction of the second half of the RF cycle. Each cycle of RF of the modulated envelope produced by the flywheel action has an almost perfect sine waveshape if the tank circuit Q of 10 or more is used."

I rest my case...

You like answering for me?

I have both and use them for different purposes There is no such thing
as one is better than the other. They both have their benefits and
both have their drawbacks.

>Any piece of digital equipment is far more
>precise and accurate than any piece of analog equipment.

Not FAR more, only more. I prefer analog multimeters over digital
because they can show trends. I also prefer analog S-meters over
digital S-meters because they have much more resolution.

Comparing apples to apples a consumer digital multimeter of the same
cost as a consumer analog multimeter has only twice the stated
accuracy. Or plus or minus 1.5 % compared to plus or minus 3 % Both
are accurate enough for this test.

> If an analog meter
>would show a change, I guarantee you a digital will also. Unless of course
>you don't how to use the equipment in the first place. That must be your
>problem.

The test was not a performed to give specific numbers. I did not
assign any db figures. That was not the purpose. Rather the test was
done to show differences.

With a readily available analog S-meter this differences can be shown.
Antenna A did show an increase over antenna B. Repeatability was
confirmed. And because of this the order or best to worst could be
attained. You do not need a digital meter to perform comparisons. You
don't have to drive a Ferrari to go to work do you?

The human eye can detect about a .005 " movement. Within a typical
consumer S -meter of 1.25 inches (not sure of exact size) you would
have a possibility of 250 marks. This is more than enough to compare
signals.

"Do you ever think about what you say before you say it?"

2651. Realistic TRC-459 mods?

Newsgroup: rec.radio.cb
Date: 2000-05-18 00:00:00 UTC
From: Ivan Dubinsky <ivandu@uniserve.com>
Message-ID: <958702794.439272@neptune.uniserve.ca>
Source record: 36424

I know that I could probably find what I want by extensive searching through archives, search engines etc. but, I'm hoping that someone can save me the trouble by pointing me to a link for modifying a Realistic TRC-459 base transceiver. I'm mainly interested in extending the frequency coverage. Mainly, I'd like to be able to get on 27.425 kHz. Thanks.

Ivan

Actually the techs worst enemy is the CB BUTCHER that messes up
someone else's CB and expect you to fix it for less! Actually there may be
worse enemies!!! How about bozo engineers designing JUNK & making junk in
RED China?
Dave!!!!!

W5LZ wrote in message <392475FD.58B6F9E5@oio.net>...

mickey,
Your right, heat is an enemy of techs, designers, and users,
unless you live in the arctic. Lots of the new radios that were
designed to run a little power have a built in fan, in addition
to the heatsink. Some might even have a 'peltier junction' to
cool the 'hot spots'.
'Doc

Ice Cold:
Why don't you come up with commie jokes instead? Is it because you are so surrounded by them in NYC that they may find you if you do? We will see how many commies there are in NY when (if) hillary wins !!!
Dave!!!!

COLD as ICE wrote in message <20000518082342.08997.00000015@nso-fn.aol.com>...
Two rednecks, Bubba and Cooter, decided that they weren't going anywhere in life and thought they should go to college to get ahead. Bubba goes in first,
and the professor advises him to take Math, History, and Logic.

"What's logic?" asked Bubba.

The professor answered, "Let me give you an example. Do you own a weed-eater?"

"I sure do," answered the redneck.

"Then I can assume, using logic, that you have a yard," replied the professor.

"That's real good," the redneck responded in awe.

The professor continued: "Logic will also tell me that since you have a yard,
you also have a house."

Impressed, the redneck shouted, "AMAZIN'!!!!!"

"And since you own a house, logic dictates that you have a wife."

"Betty Mae! This is incredible!" (Bubba is obviously catching on.

"Finally, since you have a wife, logically I can assume that you are heterosexual," said the professor.

"You're absolutely right! Why that's the most fascinatin' thing I ever heard of. I cain't wait to take this here logic class." Bubba, proud of the new world opening up to him, walked back into the hallway where Cooter is still waiting.

"So what classes are ya takin?" he asks.

"Math, History, and Logic," replies Bubba.

"What in tarnation is logic?"

"Let me give you an example. Do ya own a weed-eater?"

"No."

You're gay aren't ya!

COLD as ICE and TWICE as NICE.. Mr. ICECOLD BIG APPLE TREES says.. It don't mean a THING if you ain't got that SWING!!!!!!!

> Well then what you are saying is that there is no way that a good sine
wave
> can come out of a class c amp... is that correct?

No one denies a good sine wave can come out of a class C amp. What is being denied is that any audio on the input will survive.

You insist on calling a 175 degree Class B amp a "Class C" because it is less than 180. In practical applications, negative bias is supplied by what in vacuum tube circuitry is called a grid-leak resistor and varies with the input. It is one gargantuan switching exercise; the input from the tube to the plate tank is virtually square wave. A 100% modulated AM signal on the input would key the amp, not modulate it!

1. You are NOT running Class C or anything like it.

2. There ain't no way true Class C is linear or anything like it. Linear means operation along the straight 'line' portion of a device's response curve. You can increase the Q of a tank till your pretty pink patoot sucks wind and it is not a linear by any definition, in theory or practice.

Dick McCollum

You will probably will bet noise. You need to grounds the
engine to the car body and the - side od the battery as
well. I use #4 welding cable because it is so flexible.
You can try and build my noise filter....

NOISE FILTER
Note if the car is in need of a tune-up this filter may not
get rid of much of the ignition noise.
Here is what you do. The filter I made measures 5" long x 4"
wide x 3" high.
Lets start with a rundown of parts:- 1- 2 electrolytic
capacitors 6500 UF each at 15 to 18 working volts.
If you can find one capacitor with 12000 to 20,000UF OK but
you may need to adjust the size of filter box. Get the
Capacitors first because the size varies and will determine
the filter box size.My to capacitors measure 3.25" X 1"
diameter each. They should have a mounting bracket.

1- 1 ceramic disk.047 pf 100 V Cap.(capacitor),1
ceramic 5 pf 100v cap,
2- 1 ceramic 180 pf 100v Cap., 1 0.5 mf cap, 1
electrolytic 5mf 50v Cap.
3- 1 1.2K Ohm 5 watt resistor
4- 1 0.5" to 0.75" ID ferrite core
5- 2 chassis mount SO-239 connectors like the type
the antenna hooks on to the back of the CB.
6- 1 chassis mount fuse holder
7- 18 feet of #14 wire that is used for winding
electric motors... "magnet-wire".
8- 5/8" X 5" (length of the filter box) soft metal
round bar.
9- 1 metal project box from Radio Shack. 5" x 4" x
3"; wider if the big capacitors are larger than I mentioned
earlier
10- 12v relay like they use for fog lamps
11- 2 thick PVC or nylon washers, 1.5" in Diameter
X 3/17" thick (May have to make)
12- 6" of thin 3/4" heat shrink you can get most of
the stuff at Radio Shack or your favorite electronic
surplus.

CONSTRUCTION
We need to make a choke out of the bar, motor wire, plastic
washers and heat shrink. Cut the 5/8" bar so that it and the
2 washers fit snugley into the _length_ of the box. Drill

and thread each end of the rod to take a 3/16" or #12 bolt. This is to secure the choke to each end of the box. Heat shrink the full length of the rod. Secure the plastic washers to each end of the rod. Grove one of the washers to allow the first winding to come to the top of the choke. If the washers are thick enough you can angle drill for the wire on a angle... this makes a neat exit. Now neatly, tightly and uniformly wind the wire on the rod and from washer to washer, do not overlap wire. You should get _about_ 3 layers. With a 1.5' lead out of the grooved or drilled washer and a 6" lead from the top layer tape or heat shrink the core in place, making sure that the windings _do not_ come loose. Drill the box for the screws in the rod and secure in the center, bottom of the box as close as to the bottom as the washers will let you. The core should be no less that 0.5" from the bottom.

Over the grooved washer install the SO-239 chassis mount connector; on one of the 4 screws place a solder tag. This is the_INPUT_ so mark it. Install the large capacitor(s)... they should have a mount. Install the other SO-239 chassis connector (at other end) with a solder tag to...off to one side leaving room for the fuse holder to go next to it. REMEMBER YOU HAVE TO HAVE ROOM TO GET IN TO SOLDER LEADS AND LEAVE ROOM FOR THE LID AND SIDES SO THERE ARE NO SHORTS ETC.!

Using #12 automotive wire wind as many turns through the ferrite core as passable and connect one end to the center conductor of the input connector and the other to the choke lead. Trim leads for neatness. Connect the 5 watt resistor from the center conductor to the solder tag installed earlier. If you are using 2 large capacitors connect the positive post to the IN center conductor and the negative to the grounded solder tag. Use #16 automotive wire for jumpers. Solder in place. At the other end connect the choke lead to the center of the fuse holder lead, solder. connect a #14 jumper from the other fuse lead to the _OUT_ center conductor of the other SO-239 chassis mount connector. Also connect the other large capacitor positive lead to the center conductor and other to ground (the solder tag).To the center end (between the out center conductor or + lead) and fuse holder and connect the other end of the .024pf, 5pf, 180pf, .05mf and to ground; connect the 5mf electrolytes to the same way observing polarity. THIS FILTER IS FOR A NEGATIVE GROUND CAR IF POSITIVE REVERSE THE ELECTROLYTIC POLARITIES. Try to keep the wiring as short and neat as possible. To one of the screws of the choke attach about 14" of #10 auto wire using appropriate wire connectors. SOLDER ALL CRIMP ON CONNECTORS!

INSTALLING IN CAR
Using _#10_ auto wire run a lead directly from the battery
to a spot where the lead from the filter to the CB will NOT
be any longer than 2.5 feet. If you want the system to
operate with the ignition key install the relay in a convent
place. Attach the #10 wire attached to the choke screw to a
GOOD car ground and use as short a lead as possible. NOTE
#10 wire is used not for the sake of amps but to reduce RF
loops. Resistance is considerably higher at RF than DC.

CONNECTING CB TO FILTER
After the filter has been tested, we will connect the CB to
the Filter. For wire we will use RG8/u Mini or better yet
shielded #12 pair. Use as short as a length as possible an
keep this run away from other wiring, especially parallel.
Attach a PL 259 connector to one end of the RG8 and fix to
filter output. If there is room in the back of the CB AND it
does NOT disturb ANY wiring install a chassis mount SO-239
connector for the power in and mark RED well. If this is to
difficult then run the RG8 power line to the last 1.5" of
the power cord if it pugs into the back of the set, if the
cord goes through the CB then connect and solder inside.

TIPS AND COMMENTS
I have used this in a Blazer, Caviler, and Dodge Neon, all
have been kept tuned up. With out the filter I got some
ignition noise and severe alternator and windshield wiper
noise. All was stopped with this filter. I can't stress
enough the importance of the neatness of ALL wiring and All
automotive wiring other than the filter itself; use the
proper connectors and terminals and solder ALL connections.
Crimps only let in corrosion. Where there are bare wires
that may short use heat shrink. The RG8/u mini is to insure
the noise is not picked up between the filter and CB. This
filter is not heavy enough to run a large RF amp. or linear,
the choke wire would have to be #8 or 10 wire for any thing
over 100 watt.

Good luck and any questions... ask

> (turn on) and it also works like a million bucks.

And the modulation will cause the drive to vary above and below the level necessary to turn the amp on. Remember, a carrier modulated to %100 the carrier is cut completely off at the bottom of the downward modulation part of the cycle. And in the case of a class C amp, the cutoff point is reached long before the bottom of the modulation cycle. I am going to try to explain this one more time. You have a class C amp, it is biased beyond cutoff (that is the definition of class C), in other words the bias voltage is such that the input has to rise to a certain level to overcome the cutoff bias before the device conducts. Now you apply an input signal, just a carrier, a sine wave; if the input signal does not reach a level to overcome the cutoff bias, then the device never turns on, but raise the input signal to where it does overcome the cutoff bias and now the device begins to conduct and will conduct only over that portion of the input signal that stays above the bias cutoff level. But as soon as the portion of the input signal falls below the bias level (in the range of 210 - 240 degrees of the cycle), the device cuts off, so all you are getting out of the device are the peaks of the input signal (in the range of 120-150 degrees of the cycle). Now add amplititude modulation to the carrier signal. The modulation can cause the carrier to vary in amplititude anywhere from twice its unmodulated voltage peak to zero. Any part of the modulation that keeps the carrier above the cutoff bias point, the device will conduct, but as soon as the modulation causes the carrier level to fall below the cutoff point the device stops conducting and that part of the modulated carrier is lost for good as the tank circuit will not restore that portion of the signal. Period! Now if you tell me that the carrier is going to keep the device above cutoff during modulation, then it isn't class C, it is operating in a linear class which by definitation is not class C as class C is not linear. Again please, please, direct me to a technical publication that states you can get a distortion free signal out of a class C amp with an amplititude modulated signal on the input as you describe. Please give me one example of such a use of a class C amplifier in amateur radio or commercial use. Nowhere but on cb will you

find such misinformation and hype.

> There is a BIG difference!

There certainly is. That changing of the carrier amplititude at an audio rate produces audio frequencies in the sidebands, else there would be nothing to detect in the receiver detector circuit and no audio out of the receiver. Again you show your complete lack of knowledge on the subject.

Then it isn't producing a distortioin free signal with a modulated input signal. Again I ask you "professor" point me to a technical publication that supports your theroy, show me an example of a commercial or amateur radio amplifier that operates class C as you describe.

> >can come out of a class c amp... is that correct?

The "professor" dosen't understand the first thing about the frequencies
that are produced when you modulate a carrier with audio frequencies, he
has no concept of the sidebands that are produced that contain the audio
frequencies, he thinks you only have carrier.

2680. LQQKING 4 A TUBE MODULATOR-(NOT LINEAR!!!!!) 4 Watts in 4 watts out/ and a TON OF SWING

2684. Professor's cheezed out class B amp

Newsgroup: rec.radio.cb
Date: 2000-05-19 00:00:00 UTC
From: Smokey <Ampkiller@usa.com>
Message-ID: <eJYkOfge5qPInL2jKRGcHhWPGBMo@4ax.com>
Source record: 36457

Professor has been on the newsgroup bragging about his "new" class C amp. Its not a true class C amp, its a cheezed class B amp that doesn't have correct bias applied to it. He admits that it has some distortion. So why is he calling his amp a True C amp, and not fixing the distortion his class B amp has?

1. True class C amps have a higher effciency than his cheezed class B

Amp
(a con to sell amps)

2. He's to cheap to add bias to his amp to eliminate the distortion
(that would require additional parts, but which ones?)

3. He's to lazy to add bias too his amp to eliminate the distortion
(he would have to modify the pre-etched board he bought)

4. He doesn't know how.
(best answer, he hasn't shown any real knowledge of class of amps)

Professor, build a true class C amp, (120 degrees) use it, prove it has no distortion when used a linear amp for AM. Would you care to make a wager on the outcome?

2685. Re: class c amps ? b amps ?

Newsgroup: rec.radio.cb

Message-ID: <eKIkOdfXbQLGco=f5HZOh0Wck6bl@4ax.com>
Source record: 36458

To achieve what a class C amp has to offer, something around 120
degrees of conduction. Certainly not your cheezed class B with a .7
of a volt of turn on to overcome. It may meet the strictest of
definitions for a class C, but it sure doesn't have all the attributes
of one. Bias your amp to eliminate the distortion, and call it what
it is, a class B amp. If you really want to give any potential
customers the best, quit conning them with your class C crap.

2688. Re: K-40 vs. Wilson 1000 - Which is better ?

Newsgroup: rec.radio.cb
Date: 2000-05-19 00:00:00 UTC
From: dinod@deltanet.com
Message-ID: <4Y1V4.11886$m7.1596256@news1.rdc2.tx.home.com>
Source record: 36461

Simple answer...

Yes, the Wilson is BETTER than the K-40. As other posts state,
the Wilson has a better matching network. The K-40 uses a
capacitor that will blow with anything over 200 watts (per K-40).

The Wilson is 58% better than the K-40! They are compared to
eachother and not a reference.

The were tested using the same parameters! This is the best
test you can do! I have owned MANY K-40s and MANY Wilsons.

The Wilsons work MUCH better than the K-40.

Dino

And every time the modulation causes the waveform drops below the bias cutoff level, the device stops conducting and the rest of the waveform is lost, never to be recovered.

I am still waiting for the "professestor" to give me a reference to some technical publication that states you can get distortion free output from a class C amp with an amplititude modulated input signal, or give me an example of an amateur radio or commercial amp that makes that claim. I don't think I will ever see it.

> I rest my case...

Which only proves that the flywheel action can reproduce the sine wave part of the signal, not the complex waveform of the audio. The audio frequencies are not a perfect sine wave and are to low in frequency for the flywheel effect to have any effect of those frequencies. You cannot ignore the audio frequencies that are present in the sidebands, they are there professor and the flywheel effect cannot restore those complex waveforms. Notice they say perfect sine wave, the signal is comprised of more than just the sine wave part. Your case may be rested, but that is all it is. Again, point me to a publication that states you can get distortion free output of a class C amp with an amplititude modulated signal. I have already pointed you to a technical publication that says you cannot.

And class B does not equal class C. Notice the professor did not state
which class of amplifier the book was speaking of.

>Dave!!!!!

I answered your question. Set your radio at 1w carrier with M400 wide open. Slowly bring radio carrier up until M400 has 250w carrier. Whatever that carrier is from the radio is where you should run it.
What is maximum? Keep bringing radio carrier up until M400 has 350w carrier, whatever radio carrier is at that time is maximum. This is a nice way to setup so customer doesn't blow up.
How's that? That's as plain as I can get.

There is no carrier in an SSB signal, so according to your theory an SSB
signal would never turn the amp on.

One slight correction. You cannot amplify an AM signal with a Class C
amp without distortion. It works fine for FM or PM.

:
: Correct.

Wrong. A Class C amp works fine for FM. The reason is that it is
a carrier that varies in frequency - not amplitude. It is amplitude
changes in Class C amps that is the problem.

: > Does the carrier
: > level change with modulation on AM?
:
: You bet it does!

It does not. Check it out with a spectrum analyzer.

Oh Really..?

I love the specs where you say the single tube 6GK6 phantom puts out 30-250 watts peak. It that isn't the largest load of smoke and mirrors. To bad the average Joe doesn't have a little more background in basic electronics. I'd bet some serious diet pepsi you can't get anywhere close to 250 watts peak from that single tube. You'd lose money too, if you ever bet that instead.

And the spec promises get worse as you go up the lineup (or down the web page). A lot of technoblather is for sale to the un educated consumer.

I would hope anyone with a little burn to learn would pick up a used ARRL Handbook off EBay. Carrier Power, Input Power, Peak Power and PEP Power are all explained.

That 250 watt promise becomes pretty hard to believe... anywhere close to that is hard to believe.

Doc,
Just like my old Kenwood HF radios, the drift can be measured and corrected with a simple cap. I did it on all my radios, the end result was less than 300Hz drift complete. That's right up there with any solid state radio.
skipp

ps, the bandswitch contacts in the vfo need to be cleaned with the proper methods and chemicals. That's why I mentioned the experience requirement.

You are a fool Dean, regular transistors are current controlled devices.

Transistors do not have grids and can not EVER be driven AB2.

In reality, they only operate AB... not AB1 or AB2 which refers to the
flow of grid current in a tube.

Go buy an ARRL Handbook and read it.

Professor <bgriffey@kwom.com> wrote:
: You are missing the point! It's not lost! The high q collector tank can
: reconstruct it to original integrity.

Part of the modulation waveform is lost - as the final does not start
conducting until the bias is overcome. Because of this, the tank cannot
reconstruct the original waveform. It does not matter how high the Q
of the tank is. It cannot recreate a signal out of nothing.

: You would not be able to tell the difference listening to my class c amp and
: a class ab amp on the air. It's already been proven out on the air many
: times...

Wanna bet? If it is true, then something is occurring that is changing
the bias of the amp.

You can also hear the distortion in an AB1 and AB2 amp. But the minimal
distortion in an AB1 amp is considered to be "acceptable".

That is true for a Class A amplifier. It is not true for any of the other
classes - although AB1 comes close, as it is only shut off for a very small
fraction of the half cycle. It is less true for AB2, even less for B and
not at all close for Class C.

> which class of amplifier the book was speaking of.

He is right to the extent that if half a waveform is faithfully reproduced by the amplifying device, the other half will also be faithfully reproduced by the tank given that the tank is big enough to store the energy. Quality factor, the infamous Q, has nothing to do with it directly but as a practical matter it will be at least 10. While an RF waveform from an AM or SSB input is pretty complex, the amp deals with it as one SINE wave in a 27 millionth of a second so as long as outputs resemble inputs, it works. The key concept is SINE WAVE.

This whole debate centers about the definition of Class C. The Prof takes the position that anything running less than 180 degrees is Class C and enjoys all of the benefits of what the rest of the world means by Class C. This is, of course, more a religious exercise than a technical one. It is simply mindless doodoo based on stringing words together. There is more to Class C than degrees of current draw.

Now my experience with amps is in high-impedance devices, tubes and FET modules, rather than bi-polar transistors, so bear with me a bit; the principles are the same but terminology gets out of hand rapidly. I am going to use FET terms -- source, gate, and drain -- rather than emitter, base, collector, or the cathode, grid, plate of vacuum tubes.

In a class A, AB, or B circuit, the gate is biased (i.e. external voltages are applied that are isolated from the input signal) to establish an operating point. In Class A, this is generally in the middle of the linear portion of the FET's response curve. {Note: almost all devices response resembles a long, thin lazy S like the small sigma in the Greek alphabet}. In Class B, the operating point is near the bottom at or near current cut-off. AB is somewhere in between. This bias is held constant (trade term: it is 'stiff'). Every effort is made to deliver an amplified (i.e. the output looks like the input only more so) copy of the input signal to the drain's tank circuit. The tank does its 'fill in the dots' caper from there.

Now in Class C the whole concept changes. Only enough fixed bias is applied to keep the device from self-destruct mode when no signal is applied. With transistors this is no problem because it takes about 0.7 volts of forward bias or drive to turn them on at all but with tubes and FETs this is can be necessary.
The rest of operating bias is supplied by using the gate current drawn when the gate is positive with respect to the source. This gate current is leaked to ground thru a resistor so -- think about it -- the bias increases as the drain is driven more positive and decreases as drive decreases. There is no attempt whatever to preserve the incoming waveform in the output. Looking only at the output at the drain, the waveform looks like drek. It is not 120 degrees of a sine wave -- it is a burst of pure filth.

What you see looks like a nearly vertical leading edge, a flat-top in the middle, and a trailing edge that is less steep. As Fourier told us, it is harmonic-rich which is why frequency doublers and triplers are Class C. It is here that Q becomes a real factor if one does not like to be heard at 27.5, 55, 82.5, and 110 MHz equally well. Class C is certainly not linear, and in some respects is not an amplifier in the same sense as Class A or B. It is the beginning of switching circuits in which the tank recreates a sine wave out of an energy burst. Some posters have alluded to Class E and some later developments which are not my cup of tea; they can pontificate now.

So it seems that we have a semantic problem here. Prof wants the efficiency of burst-mode without paying the price in non-linearity by simply defining a 179 degree draw as Class C; that is doodoo. Those of us who know more than Prof have not gotten around to properly defining class C: a method which purposely distorts a waveform toward square wave to make optimum use of a 120 degree or so draw letting the tank restore the sine wave without restoring the amplitude variations.

If you don't see a gate resistor, it ain't Class C. The big thing of Class C is that the drive supplies bias via gate current draw.

Noting that the chapter cited is indeed on AM it is important to note that to properly modulate a Class C final for AM, it is indeed necessary to operate a final such that doubling drain voltage does in fact double drain current so that PEP is indeed 4 times dead carrier. The final need not be linear and isn't but it has to act as one in an audio sense to succeed. For that reason, you will often see two sets of specs listed for a transmitting tube, one in modulated AM service and another in FM, CW, FSK service.

With any luck I hope to have made some sense out of this pissing contest.

Greetings!
I have a 1/2 wave Radio Shaft antenna, It's called the "Crossbow" it was purchased around 1994-1995... (They say it's a 1/2 wave, but it looks more like a 1/4 wave "skirt" antenna..) That was given to me... I was going to give this antenna to a friend of mine that wants to get into CB, and I was wondering if this is a decent antenna for a beginner... (I've never tried the Radio Shaft "Crossbow" antennas..)
But I recommended that he get a Maco V-5/8 like I have, but he wants to see if he likes the hobby enough to put money into it...

Thanks to all!!!
Jeff...

Au Contraire, mon ami. Because a bi-polar transistor draws base current
under all circumstances, it is always AB2.. Because of this there is no
reason to use the suffix as it is understood -- by most that is.

You both mess up pretty bad...

:> "It is important to understand that in single-ended circuits, flywheel
:> action alone is responsible for the reproduction of the second half of the
:> RF cycle. Each cycle of RF of the modulated envelope produced by the
:> flywheel action has an almost perfect sine waveshape if the tank circuit Q
:> of 10 or more is used."
:>
:> I rest my case...

On what... more smoke and mirros... The above refers to ~class C
tank circuit operation. Class A operation does not depend on the flywheel
effect. Using "conventional" linear AM/SSB modes in through a "less than"
class AB (that's B and C class) amplifier produces serious distortion you
wouldn't want to put on the air.

: Which only proves that the flywheel action can reproduce the sine wave
: part of the signal, not the complex waveform of the audio. The audio
: frequencies are not a perfect sine wave and are to low in frequency for
: the flywheel effect to have any effect of those frequencies.

Not correct... it's not because they are "to low in frequency". The
flywheel is used to restore the rf waveform.

: You cannot
: ignore the audio frequencies that are present in the sidebands, they are
: there professor and the flywheel effect cannot restore those complex
: waveforms. Notice they say perfect sine wave, the signal is comprised of
: more than just the sine wave part.

Your way off track when you say the above related to your argument with
the prof.
Your getting warm about one thing though, typical voice modulation and
music are very complex waveforms.

: Your case may be rested, but that is
: all it is. Again, point me to a publication that states you can get
: distortion free output of a class C amp with an amplititude modulated
: signal. I have already pointed you to a technical publication that says
: you cannot.

You are wrong...
The technology has progressed far enough where new High Power AM Broadcast
Transmitters operate using angles even less than Class C. It's way beyond
the newsgroup to talk about them here, but you can read up on them at most
broadcast transmitter mfgrs web pages.

This is just my opinion, The old and new sound damn close, Stay away from the new 104's with the k designation, has a stupid ROGER BEEP, The old 104's were definately put together better. If i had a choice i would keep the old one, if i did not have a choice i would Buy a new one! The old Turner Plus 2 or, +2, you have is a damn good mike, in most cases better than the 104's ON SSB. I've had lots of mikes and If i could only Choose ONE it would be the D104! If i could choose two it would probably be the 104 and a +2, It really depends on the radio, mode of operation, your vioce, ETC.....
Dig up the +2, wire them both for the radio you use and get some on-the-air comparisons!

BTW: My opinion is based upon the fact that i spend most of the time on AM.

Thanks Kevin, But I think I figured out what I did wrong here. I posted on some of the amateur groups and one person there did not approve. Well to me a radio is a radio and even some amateurs (like me BD) like to fool around with and maybe even modify the 11 meter radios for the 10 meter band and work qrp! I don't know what people consider spaming but all I am doing is trying to make available some inexpensive 11 meter radios for the average Joe that doesn't have a lot of bucks to play around with. I will continue to post my radios until the majority of the people I receive email from want me to stop. Mike (WJ2D)

It proves you have a very well set up mobile and that you are getting the maximun output from your components.Low swr,low reflect,strong signal,good ground work,etc..And is`nt that what we all want whether we key or not?

I hope I did`nt brain my damage.

Hey Jimbob

There were about a dozen different Navaho's... Better say which one. (I have two right now, including a 457 and a 431 (with serial number 0001))

Let's see, in 23 channel there were the 30, 31, 48, 55, 57, ...

>why do they do so bad at the keyoffs? M

Because as with any new amp line it takes awhile to convince one of the guys with the big money it requires to put together a competition class mobile to try your amp..I`m sure if you were to take an X-Force or Mo-Watts amp and put it in Gils mobile he`d kick ass with it simply because his set up is so smooth

I hope I did`nt brain my damage.

>And is`nt that what we all want whether we key or not?

Sure it is. But there's more to it than that. If your mobile rig is so well set up that you win a keydown, or some other similar contest, great, but it still does not address how much you are bleeding on other radios or other electronic equipment. If you can get that much power out that cleanly, with no splatter or undue noise on the entire CB band in your area, as well as not interfering with local electronics (neighbor's car and home stereos, TVs, etc.) then I'd say God bless you, that's a well-constructed rig.
The vast majority of the keydown-happy crowd can't make that claim, however, so it still proves only that they feel power equals success, which is simply not true, unless all you care about is winning a keydown, in which case you probably shouldn't be in the communications field.

I had to laugh! Its called the Spirit of Americans! Duk, what does football, basketball, baseball, care races, on and on... prove.... Same idea... I think that was a pretty lame question, COMPETITION is the driving force for most everything in our country! No matter how stupid you or anyone else sees the The fellows at the keydowns, They aren't any different than any of the other folks involved in various other competitions....

And just like most other sports, the team with the best backing typically wins!

I would also disagree that no benefits are recorded..... Think about it..... better amps mean more wins..... Less breakdowns at the Competitions mean more wins..... So in the end, we do see some of the benefits..... Any Competition tends to breed BETTER COMPETITORS! This also includes the competitors Equipment..

Basically only a couple things are more important than sports in our country, Sex and money.... and i'll leave you decide the order!

God, Ethics, morality, honesty, ETC are all somewhere wiping the dust from there eyes! This is not my opinion, its more of an observation.....

The sooner folks out here move on and quit getting there underware all knotted up worrying about Illegal Linears, Stupid Cber's Stuffed Shirt Ham's Etc... Etc.... The better off we ALL will be!

Time to UN-KEY, I Smell smoke!!!

My first CB was a General MC-6. I got it in the early to mid 60s. Anyone remember them? Is there a spot on the net I can go to that has info. on them. Approaching that "old gesser" stage of life I was thinking of reliving my wasted youth. (Except for the late 60s. Not only can I not remember them... but once was enough!)

I used this radio as a base and later used it in my 62 Dodge Dart. (Thinking about it now, I don't know which was uglier, the radio or the car.).

2754. Re: Evidence...

Newsgroup: rec.radio.cb
Date: 2000-05-19 00:00:00 UTC
From: tnom@mucks.net
Message-ID: <ebobis0e5kftl562fquaaavgks9ihde7qc@4ax.com>
Source record: 36527

What does this all mean?

1. The flywheel effect is used to reproduce a nearly perfect sine wave out of a partial cycle.

2. The lower the conduction angle the harder it is for the flywheel effect to work.

3. The flywheel effect only works without major distortion if the input pulses stay at a constant rate. (no varying amplitude or frequency) or the conduction angle is great enough (180 degrees or more) to allow proper drive control of the flywheel.

4. A class B single ended amplifier can be a linear amplifier. It does this by the flywheel effect which will supply the second half of the cycle.

5. The output of a linear amplifier that goes into a unbalanced line (coax) is not really a sine wave. Rather it looks like a series of pulses of a non filtered full wave rectifier.....(nnnnn), and is representative of the input power because it is proportional to the square of the RF exiting voltage.

Hi,

I moved from Germany to the US 4 years ago and took my cb antenna from Germany with me. The problem is that the antenna's manual is lost and I forgot how to adjust SWR on it. From reading on the Web, I concluded that it might be a Sirio boomerang antenna. The antenna is 3 meters (90 ft.) max. tall, but can be adjusted lower. It is a window antenna, so right now it is mounted on the outside frame of the window. I have a CB radio and it is connected to the antenna, but for some reason, I can never get the SWR ratio low enough. The problem is that the needle of the swr meter does not go to set position when i am in FWD mode. It just goes back and forth like crazy. the SWR sometimes is almost 3 at channel 40 and 1.3 at channel 1. Is it because the antenna is mounted on a window and the wall of the house behind the antenna, blocks the signal. Any help will be appreciated. Could not find any info on this anywhere.

thanks

2767. newbie needs antenna/mounting advice

Newsgroup: rec.radio.cb
Date: 2000-05-19 00:00:00 UTC
From: Jason Arends <arends@sheerer.net>
Message-ID: <3924F49A.845AF587@sheerer.net>
Source record: 36549

hi

ok, i don't want to sound too lame asking all these questions, but what better place than here? i recently recieved a midland 75-822 as a gift, and i don't have a mobile antenna to use with it. i've done some research on the internet and most of the info i find is on the companys' websites so it's probably biased. my vehicle is a 89 s-10 blazer, and i want to mount a decent antenna on there without drilling any holes in it, 'cause it's in pretty good shape. i don't want something huge on there, maybe 3 or 4 feet above the roof.

from what i've read, a top loaded antenna is better than a center or base loaded, and from what i've seen, they can be purchased for around $20. i've noticed that there seems to be a couple major brands: firestik, wilson, and k40. that's what's available around here anyway. could someone share their opinion please on your experience with these antennas?

as for mounting options, i've been considering the luggage rack, the rear bumper, the edge of the hood, the mirror, or a magnetic mount on the roof. i understand that the higher the antenna, the better, so i was thinking more about the magnetic on the roof or the luggage rack. the only downfalls of each of these is that magnetic mounts aren't as good as permanent mounts and can damage the finish, while if i mounted on the luggage rack, i would have to run a wire to the body to ground the mount, since the rack is not grounded. any thoughts?

well thanks in advance for any insightful replies. let me know if i'm going about this all wrong, because i'm not that experienced with cb radio.

~jason

Source record: 36553

What should we see for a match on the radio side of this amp, a couple of NORMAL examples.... or rather anyone able to answer what would be typical to see for this maker..... I know lower better, lets say on a Dummy load.. I'm not an RF engineer, nor in the same league as Dave, or Dennis, or many others, on the other hand i've successfully built a few Amps And AM still learning.....

Enough Rambling, to the point, This fellow sees a match of 1.2 or so at the Antenna, Driving it extremely light, 9 watts carrier, shows about 4 to 1 SWR on the Radio. The Antenna match remains the same. I know its not what it should be, I'm not ready to mess with this Box. It seems to me i remember reading that if we have a couple of dead pills that it will (as it does) still function, but of course at reduced output and increased SWR. As I've stated only light drive so far, Have not even attempted to check output, my concern is getting it working correctly before i drive it.. Now I guess my questions are..

Do we think x number of dead 2879's may be the problem?
I'm going to rule out poor design.

Who should i look into getting this checked out by?

Please Leave the Dave, noname, Xforce Etc wars for the other posts. I've purchased this used, for what i consider a decent price and am ONLY looking to get it up and running PROPERLY! Its a decent looking, nicely made BOX, The person did a professional Job on it. And i'm happy with the little box..... so other than getting it running properly i guess thats all that counts...

Thanks in Advance!

You can be loud, and still sound good. Although I do hear what your saying.
I know some who run their mics so loud, that it sounds like they're in a
F-14 with the window rolled down. It's a fine line between being loud, and
being TOO loud.
Have a good weekend.

Not really. Some solid state radios have much less drift than that.
However 300hz start to finish is perfectly acceptable.

I have a Realistic TRC-212 (21-1662) for sale. This is the full size
40 channel unit with carrying case. High/low TX power switch. Around
5 watts output on high. LCD display with TX and receive meters.
Great shape. Original long (around 5 feet) center loaded antenna. Has
external antenna, power and charging connections. Has an 5-pin
external mic connection as well. Uses 8 'AA's or 10 'AA's
rechargeables and you can recharge the batteries WITHOUT taking the
batteries out. (Batteries and charger not included)

Asking only $ 35.00 plus shipping.
Great deal ! ! !!
A Picture can be e-mailed.

Hi Jason
My choices would be...
1) a wilson 1000 magnetic mount
2) a K40 Magnetic mount.

The whip is flexible enough to drive in a standard garage or
car port with out damage. If you have a garage door you will
have to point the whip forward against the ceiling so it
will not catch on the door when you back out

Bumper mounts are very temperamental to install and get
operational. They are directional too. All my roof mounts
are permanent mount... I am willing to sacrifice a hole for
performance and you cam get special plug for then if you
sell the vehicle that is not very obvious.

To stop mag mount scratches stretch some cellophane from the
kitchen and stretch it over the base of the mag mount. Make
it a bit larger so you can trim it with a razor blade
against the mag mount.
Cheers,
John

>This fellow sees a match of 1.2 or so
>at the Antenna, Driving it extremely light, 9 watts carrier, shows about 4
>to 1 SWR on the Radio.

1. Mfr recommends 12' jumper between radio and box.
2. If this is a straight 12 (not 4 driving 8), you are underdriving it and therefore will see a high swr. This unit will easily cruise at 2500w pep, therefore your out carrier should be at least 500w and out pep should have enough drive to get it to 2kw. A radio alone is not enough drive.

Professor,
I'm afraid you haven't 'proved' your point. Your quote specified that the applied signal was a sine wave, and the 'flywheel' effect 'produced' the second half of this wave form in the output. That in it's self is true. But we're not talking about a simple sine wave, we're talking about a complex wave form such as speech. The 'flywheel' effect can not faithfully reproduce the second half of a complex wave form because it 'could' ONLY attempt to reproduce the first half of the complex wave form, it's the only part of the wave form it's 'seen'. Since the amplifier was 'turned-off' during the last half of the complex wave form, it can't possibly reproduce it. Wanna try again??
'Doc

Jason,
With your stated choices, a 'lip' mount on the hood is
probably the way to go. Although, a magnet mount would
work just as well. No matter what you do with a mag-mount,
if it's left on long enough, it will damage the paint.
Just for information only, a hole in the roof is no big
deal if/when you trade your Blazer. If you don't want to
have the hole 'filled', mount a cell-phone antenna there.
That should -increase- the blazer's value.
'Doc

Source record: 36576

If I mount a trunk lip antenna to my trunk lid on the edge nearest my rear window in the centre, which way will my radiation pattern be strongest ? To the rear or the front of the car ?

Also, if I attach a wire braid from the trunk lid to the car body to help improve the ground plane, will the pattern be changed much ?

Richard.

Also, if I attach a wire braid from the trunk lid to the car body to help improve the ground plane, will the pattern be changed much ?

Richard.

---

the signal strength would be more to the front i believe , and a secondary ground is allways a good idea . but i don't think it would change anything much

> > There is no carrier in an SSB signal, so according to your theory an SSB
> > signal would never turn the amp on.

There you go flaunting your ingnorance for all the world to see again prof. When you modulate a carrier an upper and lower sideband are generated, each offset from the carrier frequency, the offset being determined by the frequency of the audio. The audio is contained in the sidebands, not the carrier. In a balanced modulator there is no RF generated until audio is applied, which unbalances the balanced modulator, and only the two sidebands (RF + audio) are generated, the carrier frequency is suppressed (double sideband, suppressed carrier). One of the sidebands is filtered out so all that is transmitted is one sideband, no carrier (single sideband, suppressed carrier). Yes, there is RF in the sidebands but it is not the carrier. That is why the carrier must be reinserted in the receiver to detect an SSB signal, BECAUSE THE CARRIER IS NOT TRANSMITTED.

For your education prof this is from the ARRL Handbook, direct quote except for (). See if you can comprehend it.

"A fully modulated a.m.(a.m. means amplititude modulation, not morning just so you can keep it straight prof) signal has two-thirds of its power in the carrier and only one-third in the sidebands. The sidebands carry the intelligence to be transmitted: the carrier "goes along for the ride" (no audio in the carrier prof) and only serves to demodulate the signal at the receiver. By eleminating the carrier and transmitting only the sidebands, (note here prof, the carrier is eleminated and is not transmitted) or just one sideband, the available transmitter power is used to greater advantage. To recover the intelligence being transmitted, the carrier must be reinserted at the receiver." Now why must the carrier be reinserted at the receiver? Becaue the carrier is not transmitted in an SSB signal.

I know you strive to be a real wit professor, well don't give up, your half-way there.

I saw an antenna on TJM's web site.
www.tjmproducts.com.au
It is the one on their main page that is on the front bull bar of the red truck.
I have never seen this antenna before and I like the way it looks. I have e-maile their site but have not gotten a response.
I understand that this pic was probably taken in Australia and that the antenna might not be for a CB. Does anyone know if this is for CB of can be converted to CB. Even if I cannot use it I am willing to buy it for the looks alone. If you know of any other rugged looking antenna's or other accessories for my truck (2001 Silverado, I expect to take delivery on the truck in August) I would appreciate it.
Thanks, Jamo
jamo1911@bellatlantic.net
If you can reply to my e-mail also that would be helpful to me.

mickey
i believe that if you set a rig up to swing with your modulation,you should never need a fan.if you set your rig to key a high wattage and have no swing you will get a lot of heat.this is the product of chop shop work.they know that if you talk long enough those transistors will heat up and blow out.you will also give your mod a little more room to work if the finals don't heat up.i said finals but mean driver and final for those tech's that hate to hear that word.

Bigmoney, If you read his original question you will see that he was
asking why someone would mount these antenna's like that. I thought it
was a legit question. Who know's why the guy mounted it like that. He
might just be some moron who likes the way it looks. They might not
even be for the same radio. I know a guy who has 2 antenna's because
it pisses his wife off. One of them has a dummy cable hooked up to it.
He calls it dual redneck.
Pardon me for budding in, I just can't figure out why you are picking
a fight with someone who you'll never get a chance to actually hit (or
twist up). It just seems to me that you feel safe starting a fight
here and not at your local watering hole.

Richard,
If there is any directionality at all, it will probably be toward the fron of the car. Don't expect in the way of a directional pattern, the base of the rear window is very near the center of the car.
Adding a ground strap from trunk lid to car body surely won't 'hurt' anything, may not help much either, but can't hurt. 'FYI' - Braid does not make a very good grounding strap if exposed to the weather. All the polutants, etc, tend to 'rot' copper braid. Inside the trunk, I wouldn't expect too much 'weather', though.

wrote:

>He did not mention any class specifically. Stop putting words in his mouth!
>Well... you're such a wise guy. You post a quote from a book that refutes
>this statement pertaining to single-ended class C. Be careful... I will
>check it's authenticity.

If you would keep reading or include the text that disproves your
theory (flywheel can remove distortion in class C) then you would see
that you are wrong. seeing how you asked for it, a quote, then I will
furnish it.

This is very elementary stuff.....Any first year apprentice Professor
should already know this.

>> Single ended class B devices are perfectly acceptable with RF
>> waveforms. Even amplitude modulated RF waveforms.

" Class B amplifiers used as radio frequencies are known as
linear amplifiers because they are adjusted to operate in such a way
that the power output is proportional to the square of the RF exiting
voltage. This permits amplification of a modulated RF signal without
distortion. Push Pull is not required in this type of operation."

" An operating angle of less than 180 degrees leads to a considerable
amount of distortion, because there is no way for the tube to
reproduce even a half cycle of the signal on the grid. Using two
'tubes in Push Pull would merely put together two distorted
half-cycles. An operating angle of less than 180 degrees therefore
cannot be used if distortionless output is desired."

"In a class B amplifier, device output current flows for half the
cycle or 180 degrees. What is important in both the flywheel system
and the RF power amplifier is that the drive system supplies enough
energy to keep the flywheel turning or the tank current circulating.
It is also important to note that as the conducting angle decreases,
control of the flywheel or tank circuit is given up. The amount of
energy transferred from the flywheel or the tank circuit into the load
is decreasingly controlled by the drive system. Reproduction of
changes in the drive energy level at the load (also referred to as
modulation), deteriorates as the conduction angle decreases. In
an RF power amplifier this is called distortion."

ok an analogy

there are two types of races ..... sprints and long run .

the sprints , cars built to do max horse power for a short period of time . but they are also noisey , stinky and blow up alot . and have to be rebuilt after every race . winning a sprint proves that you can make an engine run for 5 seconds at 1000 horse's .

but races like the baha , that last for hours and ever days are different . those trucks are built to doa fair amount of HP for a LONG time . winning one of those long races proves that your truck can preform the best in long term conditions , and it may not be the fastest ... but the most reliable .

i would guess-ta-mate that less that 50 % , maby well less than 50% of amp buyers are in the keydown crowd . and that majority of people are not looking for an amp that will key over some one in france for 60 seconds than pop 14 pills . they are looking for an amp that kicks out a decent wattage , and will last long term .

i wish there was a contest to see who had the oldest amp , with all the origional parts that keyed at the highest % of what it was built to do . and to see who had the cleanest audio

:> Rubbish! Why do you think they call it amplitude modulation!

Maybe for the simple reason that the amplitude of the sidebands
varies. At least, I would hope that was the reason.

It is not called an "amplitude modulated carrier" signal.

Brian. You usually post some pretty good stuff here - but you are
extremely off base about this topic.

I suggest you spend a few days reading some decent texts on the
subject. I think you will find it enlightening.

: broadcast transmitter mfgrs web pages.

There may be newer classes of operation where that is possible, but it is
not class C - with one exception.

AM broadcast stations have transmitted using Class C amplifiers for many
decades. But they use Plate Modulation - where the carrier has already
been increased to its full output level BEFORE the modulation is applied.
There is no further amplification of the signal - so distortion does not
occur.

If they do sound clear (I assume this means without splatter), then it
means that they are not running Class C.

It is hard to hear even as much as 25% distortion, for most people. With a
bit of training on what to listen for, 10% is relatively easy.

To detect distortion levels much below at the transmit frequency requires
electronic test equipment.

: connected to the antenna, but for some reason, I can never get the SWR ratio
: low enough. The problem is that the needle of the swr meter does not go to
: set position when i am in FWD mode. It just goes back and forth like crazy.
: the SWR sometimes is almost 3 at channel 40 and 1.3 at channel 1. Is it
: because the antenna is mounted on a window and the wall of the house behind
: the antenna, blocks the signal. Any help will be appreciated. Could not find
: any info on this anywhere.

It sounds like you have a continuity problem - or your level knob for
setting the forward reference power level is intermittant. Another
possible cause is that you may have RF on the coax that is affecting
the SWR meter.

Unless the house is within a few feet of the antenna, it should not affect
the SWR appreciably.

I don't like window mount antennas - even full length ones. I prefer an
antenna where there is a positive ground at the base of that antenna.

But not the audio frequencies. A portion of the audio is lost due to the amp operating over less than one-half of the cycle, that portion of the signal cannot be restored in the tank circuit.

There are broadcast transmitters now that use output modules of different power outputs that are turned on and off at the audio rate to get the different power levels for amplititude modulation but that is way beyond anything that is being discussed here. They operated very efficiently even beyond class C.

I have used a Wilson 1000 magnet mount. I keep it for a spare. My regular antenna is a KW-7 Firestik. I have gotten good results from both, however I find better performance from the larger (and cheaper) Firestik. Bear in mind that the Wilson was stuck on the roof, while the stick is mounted on the trunk or rear bumper. (I have 2 mobiles, 8 tires to feed :) YMMV.

Part of the gain in performance may be due to the real ground at the base of the stick. I beat the hell out of the stick when I four wheel, still works great, so don't worry about durability.

Killrwatt wrote:
>
> What would be freq range in stock trim? not referring to 11 meters....

It'll cover 3-30 MHz, but be careful.
As you lower the operating frequency
the gain goes up. As the gain increases,
the likelihood of instability related
problems increases.

A neat trick is to keep an SWR meter in
the line between the amp and the antenna.
The SWR meter will show increases in
instability as increases in the output
SWR. The reason being that as the amp
becomes more unstable, the amount of off-
frequency crap in the output signal
increases. The off-frequency component
will be rejected (reflected) by the
antenna and will increase the reflected
power figure which, in turn, will increase
the SWR reading. The actual SWR is not
changing--only the SWR reading. The
difference in SWR readings between the
amp off and amp on conditions is a rough
indicator of the amount of instability.
This assumes that the antenna isn't
breaking down under the increased load,
and that the SWR reading will naturally
increase to a certain degree as the output
power increases due to the non-linear
characteristic of the diodes used in most
SWR meters.

If you are thinking of using a DX1600 in
a ham application where you'll be using
it on the lower bands, I suggest increasing
the amount of negative feedback. Each
power transistor in a DX1600 has a negative
feedback loop consisting of a capacitor and
a resistor connected between the collector
and base. The feedback loop part values
will vary depending on how old the amp is.
A .01 uF, 25 volt cap and a 2 watt, 68 ohm
resistor is typical. Changing to a .1 uF,

25 or 50 volt cap (ceramic disk type) and
a pair of 2 watt, 68 ohm (or even 56 ohm)
resistors will improve the amp's stability
at lower frequencies. In a nutshell, the
.1 cap closer to resonance than a .01 at
lower frequencies, and the resistor value
is the main factor in how much feedback is
applied. The lower the resistor value, the
more feedback. But be careful, the lower
the resistor value, the higher the current
through the resistor. That's why I suggest
using two resistors in parallel.

These tips apply to any broad band, solid-
state amp that uses bipolar devices and has
no band-specific tuned output circuits.

I hope this helps.

Could be one of a number of different antennas - either amateur or RFDS, and if you could se it in more detail you would be able to see the "tap" on the side of the antenna. The idea is that with a wandering lead you plug the lead into the tap which has been pretuned to operate on a certain frequency. For example on one of my RFDS antennas I have 7 taps, which allow for operation on a number of different frequencies between 2 megs and 7 megs. As such it would probably be useless for CB use unless you are running an auto tuner - when you do it works very nicely!!
In Australia we have an HF network (frequencies in the range of 2-24 MHz - roughly) known as RFDS (Royal Flying Doctor Service) which anyone can use. Licences cost $30 per year and whilst there are conditions relating to it's use it is an excellent service which is mainly used by the outback community but a lot of "city slickers" also utilise it - mainly when they go bush. This style antenna is an older one as most of the newer radios come with an auto tuner which you bolt onto your bullbar which is a lot easier than getting out of the car to change the position of the wandering lead!! Here are a couple of URL's with more information for you -
http://members.iinet.net.au/~barrett/
http://www.outbacker.com.au/

It may be hard to find a schematic for that specific
model. There's an old schematic floating around for
the old 550 (now called 667). It's the basic 4 device
design with a one device driver stage. Depending on
what you need it for, that schematic is probably close
enough. If no one can get you anything better, e-mail
me and I'll e-mail a copy of it to you. As for the
transistors, many of them used 2SC2290s. Prior to that
I'm not sure. The 2072 is a possibility, however they
where probably using 1/2" flange transistors like the
MRF454 or the TRW units.

DukkhaKoti wrote:
>
> what does winning a key down prove ?

It proves you were the best that day, in that class,
under those conditions, versus the others that you
had to compete against.

> how does winning a keydown relate to long term amp quality ?

Competition conditions are extreme conditions.
The engineering that leads to a reliable
competition amp has a spillover effect that
improves the quality of daily-use amps.
Also, you'd be surprised how many people
run their daily-use amps using close to
competition conditions (high input drive and
supply voltages).

A good anaology is that what is now run-of-
the-mill used to be the leading edge.

> how does winning a keydown relate to sound quality ?

Audio quality isn't the issue at a keydown.
However, that doesn't mean competition grade
or near competition grade amplifiers sound bad.
Audio quality as it applies to amplifiers has
more to do with drive level, input signal audio
quality, biasing, and stability than whether or
not an amp is used in competition.

Let's take those variables one at a time:

Drive level: Many systems sound bad because
the amp is overdriven. The design of the amp
is still sound, and the audio is improved by
simply lowering the drive.

Input audio signal quality: In many cases
the amp or amps are blamed when in reality
the distortion is in the source signal. All
of the radio mods that create loudness, for-
ward swing, or allow a radio to match a small
amp (with maximum output) cause distortion.
Overdrive and overmodulation go hand in hand.
Unless the amp in a modulator, all it's trying

to do is produce a larger version of the input signal. Most do a pretty fair job of it when operated within their linear transfer characteristic (that means not overdriven).

Biasing: If the amp is solid-state (bipolar devices) and is unbiased, there is a bit of extra distortion created when on AM, and more on SSB if the drive signal is small. However, that bit of distortion is insignificant compared to the distortion created by overdrive and overmodulation. Adding forward bias gets rid of that small source of distortion, and is recommended for SSB use, but will make the amp less reliable under competition conditions. Adding negative bias will move the amp farther into the Class C region and will increase the distortion, but it may improve the amp's performance in competition. So, in a nutshell, biasing is a variable that has to considered when thinking about what an amp will be used for. Most of today's comp amps are simply unbiased--which is not a radical approach and does not degrade the audio quality by very much.

Stability: Comp amps and their associated set-ups are usually very stable due to the fact that an unstable amp won't last under competition conditions. Instabilty can cause audible distortion; however, that's usually a bigger problem in daily-use set-ups that include mass-produced amps. So, on this front, the comp amps actually have the edge in most cases.

So, there you have it. Comp amps and the whole competition thing is not evil in and of itself. The operator's desires and what it takes to achieve them is the most relevant issue. To achieve the highest levels of performance, compromises have to be made. The compromises are what lead to the problems. The compromises originate in the heads of the operators with the big desires and the techs who go about doing whatever it takes to please the operators. It's a people thing. For example, if keydowns were the only place where overmodulation, overdrive, and the use of high power took place, the overall CB situation would be alot different. That's

not the case due to human nature (man's com-
petative instinct).

This is a very clean ALL MODE almost like new radio. Has minor scratches
where
mounting bracket goes. Other than that, perfect cosmetically and
operationally.

AM, USB, LSB, FM and CW

Chipswitch adds memories, etc. including CB band.

See http://www.chipswitch.com for full details.

Comes with Mike, manual, power cord

$210 shipped to you (CONUS only).

If their coils are still inline, it ought to work like a shortened (coil-loaded) dipole. It would also be rotatable, which may garner you some directivity. A halfwave dipole has a pattern that favors the lobes broadside to the line, and has nulls of the ends. Rotating this set-up may get you some gain in that sense, but since it's a shortened load it may not. Anyone else? Linus

Source record: 36624

Hi all
I've had a handheld CB for a while now and I had it connected to an magnet mounted external antenna. Last Wednesday I decided to get a Radio shack TRC-503 CB and I kept the same antenna. After we installed everything we hooked it up to an SWR meter and got a reading of over 3 (in the red) which meant we have a bad ground somewhere. We directly hooked the CB up to the battery we came to the conclusion that it was the cable/antenna. After 3 days and lots of testing later we know that nothing is being shorted out and we have continuity throughout the whole system however we are still in the red. At this point I'm confused as to what's going on. It seems to me that the antenna is not grounding correctly so I was wondering what other people have found and just exactly how many of you actually test your system with SWR meters and so on and so forth. Any input would be appreciated.

Thanks,
Dave

>My main concern is if the davemade 3 pill amp will operate cleanly on 10
>meters in addtion to 11 meters?

I would recommend an even number transistor amp that is biased for SSB use. I know the X-Force makes a (4) 2sc2290 unit biased class B that would be perfect for the combo you're looking at, or you could simply go with the (2) 2sc2879 unit setup the same way. For AM or FM use, keep carrier from the radio at 3w or so.

>Also I would like any opinions on the magnum 257 and its abiity to drive the amp.

This is a nice radio, nothing really compares to it for the price, try to make sure you get the latest unit that has variable power.

When I was 14, I hoped that one day I would have a girlfriend.

When I was 16 I got a girlfriend, but there was no passion.
So I decided I needed a passionate girl with a zest for life.

In college I dated a passionate girl, but she was too emotional.
Everything was an emergency, she was a drama queen, cried all the time
and
threatened suicide.
So I decided I needed a girl with some stability.

When I was 25 I found a very stable girl but she was boring. She was
totally predictable and never got excited about anything. Life became so

dull that I decided I needed a girl with some excitement.

When I was 28 I found an exciting girl, but I couldn't keep up with her.

She rushed from one thing to another, never settling on anything.
She did mad impetuous things and flirted with everyone she met.
She made me miserable as often as happy.
She was great fun initially and very energetic, but directionless.
So I decided to find a girl with some ambition.

When I turned 31, I found a smart ambitious girl with her feet planted
firmly on the ground and married her. She was so ambitious that she
divorced me and took everything I owned.

Now I'm 40 and all I want is a girl with big tits.

COLD as ICE and TWICE as NICE.. Mr. ICECOLD BIG APPLE TREES says.. It don't
mean a THING if you ain't got that SWING!!!!!!!

2860. WTD: ROYCE 642 MANUAL

They look an awful lot like some antennas that came off of some military vehicles that were bought by the town I grew up in. I managed to get a couple, still have a spring somewhere. Color was green though but they did have the white part about a third of the way up. With a tunner I think they were supposed to be good for 3 to 30Mhz. They were made of heavy copper foil on a fiberglass. Think they were Korean War era vintage. One of the antennas I had was mounted on the mother of all ball mounts and that was mounted in the center of a foot wide ceramic insulator. I know they were longer than a CB antenna, probably about 15 or 16 ft.

---
most often i do not know what i am talking about .

but most reciently , from reliable sources i have learned , if i understood
them right . that class b amps sacrifice effecenity for audio quality . ofter
class b amps run hotter than class C , beacuse effeceinty is lost as heat . and
i am sure someone that deals with amps alot could tell the difference between a
c amp and a b amp , on AM or SSB .

SlapNutz,
What I don't understand is why it bothers you if he did
build this amplifier, or not. Building an amplifier really
isn't all that difficult. It just takes a little time and
care in assembling. I don't build them, 'cuz other people
build them much better than I do. Still don't understand
why it bothers you.

Source record: 36659

David,
Try this. Check to see if, or where the SWR starts to
go down. If the SWR lowers a bit on the low channels, and
rises on the higher channels, then the antenna is too long.
If it goes the other way around, then the antenna is too
short. It sounds very much like the antenna just needs to
be tuned for the correct frequency band you are using.
All radios are not created 'equal', and hand-held radios
even more so. I'm talking about input impedance, what the
radio wants to 'see' in an antenna's input impedance (50ohms).
Hand-held radios, if you can connect an external antenna to
them, have to deal with a wide range of input matching in
antennas. The little whip that comes built in to the HT is
no where near 50 ohms, so they have to use a matching
circuit for it to work. If the HT allows you to use an
external antenna, it has to have some other means of matching
that antenna (additional circuit). There are various ways
of doing this 'matching', some of them much 'better' than
others. Those 'others' can be very cheap, and attractive to
the manufaturors. Mybe thats whats going on with yours...
In your case, forget about the grounds and try re-tuning
the antenna.
'Doc

Klyben,
Assuming that you do it correctly, sure, it will work.
How well it will work is a different story. No 'shortened'
antenna is ever as good as a full sized one. Because it is
shortened, it always 'gives up' something somewhere. In
the case of a 'beam' like your talking about, it usually
gives up bandwidth, and some sensitivity. You couldn't
go as far in either direction from the resonant frequency
as you could a full size antenna, and you probably won't
hear as well as a full size antenna. But, that doesn't
necessarily mean it isn't worth doing! Like any antenna,
it needs to be as high as you can get it (at least 1/2
wave length aove ground) for the directional pattern to
'show up'.

I've seen some of the Radio Shack antennas have problems
when they were first put together. Almost as if there were
a corrosion or annealing of the contacts that acted as insulators.

A friend and I both picked up the 5/8 Mag Mount for 2M. I threw
mine on the Jeep and it was perfect! His SWR was ski high.

So as a sanity check, we swapped antennas. Proved his
antenna was bad. So, we put the thing back and swapped coils
and whips by peices. The problem seemed to follow the base,
which didn't make sense.

Suddenly somewhere along the line every thing worked fine. We
went back to 'his' and 'mine' and both were great with almost a
perfect match center band.

So, taking it apart, futzing with it (that's a technical term) and
putting
it back together cleared up whatever problem there was.

Give me a break! The ARRL manual also contains information how to build solid state amplifiers as well, and besides, class C is class C whether tube or solid state. The same theory applies.

Source record: 36667

As an adjunct to this topic, I just built a halfwave dipole for 27 MHz this weekend. It's 17 feet long (8.6 feet each element) and about 17 feet above the ground.
Switching between this and a SolarconA99, and between two rigs (Kenwood TS850 and Cobra 2000, talk about disparate power levels!) revealed some very interesting things.
From my station in SW MO., a fellow in Virginia Beach, VA. could neither hear nor read on his S-meter a detectable difference in strength between the Cobra on the dipole and the Kenwood on the Solarcon. BUT, the Cobra was not as loud as the Kenwood when it (the Cobra) was on the Solarcon and the Kenwood was on the dipole.
Just fun observations, and I'm glad to have that dipole, with the Cobra 2000 (only sending about 4 watts) and that dipole I'm getting some really nice reports all over the eastern half of the country (conditions are a little weak lately!) and since the dipole is oriented in a NW to SE angle, it garners me some 'gain' over the Solarcon in about half of the stations contacted.
For about $15 (and it can be done even cheaper than that!), I'd say it's worth a shot.

In addition the dipole will receive less man-made noise then the vertical.
Your results coincide nicely with what has been fairly widely known in
comparing those two types of antennas. Good luck 73 / DX

Cobra XL-450 4 Stage 12 Volt Amplifier

This ia a 450 watt 4 Stage Amplifier. Low, Med, High,
and Max. You can put up to 4 watts drive into this amp.
This amplifier can put out about 450 watts depending
on how much power you put in. Also has a pre-amp and
SSB mode. Used on the bench for two weeks.
Works very well. JPG picture on request.

$175.00 shipped

Wire and circuit traces can have capacitance... resistors too.. provided the right frequency and proximity to other parts of the circuit being designed. In many older 'hard-wired' tube rigs, disturbing or rerouting the wiring harnesses inside can affect circuit resonance and tuning.

And if you are getting good clean non-distorted audio out of the amp, it
isn't running class C no matter that the person who sold it to
you/manufacturer/lable-on-the-front says it is. It is probably running
class B and you've been duped into thinking it is class C.

>If you cannot sound good on class c
> amps then you better take CB RADIO SETTINGS 101. I have heard both my mobile

>
> 937 chicago.......

There is your problem, you probably took CB RADIO SETTINGS 101, written
by the professor no doubt. If you think you can get distortion free
output from a class C amp with an amplititude modulated signal on the
input you need to take BASIC ELECTRONICS 101 written by someone who
knows real theory, not this cb hype.

The amps are not class C. They are zero biased and as soon as the input
signal overcomes the fraction of a volt necessary to turn the device on,
it starts conducting which is class B. For class C the device has to be
biased beyond cutoff.

: MHz area?

For 800 to 900 MHz you probably just want an rf amplifier. Unless your
using ACSB mode, a regular fm amplifier would do the trick much better. I
see them on Ebay all the time. Lot's of excess cellular stuff on there
cheap. Most of it is 12 volts.

Cliff,

If that other guy doesn't set you up with the paper work, email me and
I'll try to help. Look inside your skipper, is it the one tube driving
three like most..?
Palomar made some really great amplifiers for quite a time. As the fcc ban
came out, the amps changed quite a bit and the name went away as these
amps "went underground".
I've seen a number of knock off (copies) made using the palomar names and
model numbers.

cheers

First, Why don't you try using the SPELL CHECKER on whatever you are using to post.....

> sports envolve skill , key downs don't . you talk an amp that some one else
> built .

Knowledge could be considered SKILL! Knowledge, and even $$$ can make the difference of winning/losing.... Skill is NOT always a prerequisite of sports.... And WE ARE NOT TALKING JUST SPORTS! Grab a Dictionary and look up COMPETITION..... You don't need any SKILL to compete! you may not win, but you can still compete! And not all the folks Buy the Amps, Antennas, Etc. Some Build and maintain there own systems, Some tune there own radios, Just getting everything to work properly is a Skill!

I deduct by your narrow minded answers that no matter what i say you will attempt a negative come-back! You see the world only as you wish to see it, your mind is in-capable of new thought or being open!

plug it into a cb that someone else built , hook it up to a antenna
> that someone else built , power it with a alternater that someone else built .
> othen than knowing how to get the most from your antenna set up . no skill is
> needed .
>
.
>
> not dirictally , i live near chicago , and have listened to a few on the cb .

Listening to a keydown on the radio WOULD BE pretty DULL! but then I bet You could really define Dull!

> if i wanted to i very easiely could be in a key down .

Like someone before me said
"BEING IN ONE, AND WINNING ARE TWO DIFFERENT THINGS"

but i don't care to be
> in one

Well I'll have to say, I really don't care that you don't care! But in the end why gripe, complain, piss-and-moan, bitch, rag, or generally be a WHINER about someone elses activities, especially when they do you NO HARM.....

And the outcome ONE-WAY-OR-ANOTHER, makes no difference to YOU!
Coversation, Attention, Whatever, If thats what you want better ways are
available for you to be noticed....

True, but it shouldn't matter. Classes of amps are the same no matter what technology is used. What the AARL book didn't say was that even though a class C amp has distortion... it can be cleaned up by a high Q tank. They didn't say it couldn't be done! They were merely stating a true fact. But that is only half the story. On the other hand... the posted quote I made clearly showed that what I say is true. Aloha...

Hillbilly Dave,

Thanks for the info,You mention the filters on the 257,am I correct in assuming that the rig has somewhat of an intermod problem.
Also, do you have any experience with a davemade on 10M? Are they stable/clean operating that high in freq?(Given proper installation,grounding,SWR etc.)

Hillbilly Dave wrote;
I like the 257's... I have one in the wife's car and another one in my van. we use them both on 10 and 11 mtrs ssb and fm and have had nothing but good luck and good reports from them....the mic that come with them is a dinky little thing but has some of the clearest modulation i have heard..nothing but good audio reports. the rcve filters arn't as good as say the grant or 148 but are acceptable..

Rolling radios,
Why do you recommend an even number transistor amp?There is one other thing that I would like to avoid and that is the need for a driver.I also don't need an am dead key of anything over 400W.

Rolling radios wrote.
I would recommend an even number transistor amp that is biased for SSB use. I know the X-Force makes a (4) 2sc2290 unit biased class B that would be perfect for the combo you're looking at, or you could simply go with the (2) 2sc2879 unit setup the same way. For AM or FM use, keep carrier from the radio at 3w or so.

Sully

mcyclemem,
Sure, you can use a mobile radio in the house. It does require that you have some type of 12 volt supply to power the radio, and some kind of antenna. There are plenty of different kinds of antennas around that would suit your purposes(no ground). How well it all would work is another story.
The 'fold over' antenna may be a bit hard to find, they aren't too common. It shouldn't be too hard to make, or adapt from another kind of antenna though. Radio'ing from a bike is definitly different! Bunch of things to consider that you normally wouldn't have to worry about in a car/truck. Noise is going to be your biggest problem. The normal wind noise, plus ignition noise. A motorcycle ignition system isn't as 'easy' to clean up as a car's. Mainly 'cause it's not 'done' that often. It should work about the same though. Good luck with it....

Source record: 36763

Ben,
Here is the 'magic' number, 468. If you divide this
number by the frequency in Mhz, you have a 'ball park'
length for a 1/2 wave dipole. You feed it in the center.
Put it up about the same height as the antenna is long,
or as high as you can get it. A few feet one way or the
other isn't gonna make that much difference.
For example:
Ch-19 = 27.185 Mhz

468 / 27.185 = 17.21 feet

each 'leg' is 1/2 of 17.21 feet = 8.6 feet or 8' 7"

to make things easy, you want to add about a foot to this
so you have enough wire to make connections. Like, you need
enough extra wire to twist around an insulator.
You have to tune a dipole (adjust it's length) to make
it resonant. String it up, check to see where the lowest
SWR is. If it's too low in frequency, the dipole's too long.
If the SWR is lowest at a frequency higher than what you
want, you need to add some wire. This is where that extra
wire comes in handy (wrap the extra wire back on to the
dipole till your finished). Easier to cut off than to
solder back on. When you get the SWR lowest on the frequency
you want, tidy things up, and quit.
The 'magic' number is 468, don't tell anybody, keep it
a secret.......

For the last time... (you're getting as bad as numbnuts)
Zero bias amps are class C! They are biased beyond cutoff as you say!
You got a mental block on this one...
Biasing is a NO SIGNAL parameter!!!!!! Don't talk about when the signal
starts coming in... it has nothing to do with the bias or class!!!!!!

"JR" <jr@some.net> wrote in message news:3929819A.3712@some.net...

Hi all,

I'm just recently getting back into this mess <g>, back when I was into it, transistor amps weren't really around much yet {ok, so maybe I -was-there for the recipe to dirt!), so, tell me,,, can you mix the two styles of amps {ie... drive one type with other}? What all else should one know about 'between the two'?
THANKS..

Does any one know any mods for the hy-gain 16 cb? I just got one for a dollar at the Dayton Hamfest, and I was wondering if there's an easy way to get it a little out of band and maby a little more power? Looks like its a PLL 40 channel AM. If you know a way, please email me at kilowatt@cinci.rr.com Don't reply to the email listed with this email - its made up. Just reply to kilowatt@cinci.rr.com .Thanks!!!

Really, any information would be usefull.

73s!

2955. Value of Elite linear?

Newsgroup: rec.radio.cb
Date: 2000-05-22 00:00:00 UTC
From: pepper99@NOSPAM.home.com
Message-ID: <3929b861.528820276@news2.rdc1.on.wave.home.com>
Source record: 36812

I've got a 10-11 Meter Linear amplifier that I've had in storage for about a year and have finally decided that I won't have a usage for it at any point in the near future, so I've decided to sell it.

I want to list it online, but I've managed to forget all of the vital statistics on it, including wattage.. Duh. I looked fruitlessly for the manual, but had no luck finding it either, so I'm still in the dark.

Here's the identifiable markings/stickers on it, perhaps someone can give me the info relevant to it?

<Sticker> Elite Line Tx5500
<Controls> Low/Med/High/Max switch, Power & Preamp switches
<Lights> Power, TX Indicator, Pre-Amp on indicator.

Case is machined aluminum with large heat sinks on top and both sides. Bottom slides off for service and control of input wattage.

I also have pictures available that I took today, but havn't gotten them out of the digital camera yet.. If anyone would like to see them, let me know, and I'll make them available ASAP.

As I mentioned, I need an estimated used value for this unit. It's approximately 2.5 years old, gently used for the first 1.5 years, and has been stored since. It works 100%, and is physically in near mint condition.

Any help appreciated!

Don't see why not... as long as the interface impedance (50 ohms) is the same on both amps.

In a "no-bias" bipolar amp... it starts conducting after it overcomes the
base-emitter diode drop.

When you hear your voice coming from inside the amp it is usually from a lot
of drive. And yes an amp that is in oscillation will defiantly burn one up.

2979. Question about Palomar 225 on SSB

Newsgroup: rec.radio.cb
Date: 2000-05-22 00:00:00 UTC
From: "Patrick W." <patrickw@cei.net>
Message-ID: <GQkW4.40$Zk1.2128543775@typhoon.cei.net>
Source record: 36836

Hey all,

I was thinking about buying this cheap palomar 225 amp, to use on sideband on my base. I have a big enough power supply to run it (30 amp), and it is going to be used on a base station.

It's class AB, does anyone have any input on this amp?

http://www.coaxkid.com/pal225.htm

It's only 99 bucks, so it's kinda hard to turn it down.

Patrick

I've never owned a JoGunn, but I have done extensive work with yagi type beam antennas. And some of the of the specs they list are really far fetched.
and for most of the guys in my area who run them dump alot of fire through them...any antenna will talk if you dump 5k+ into them. My choice is still a Maco or Moonraker.

How about calling them what they are; "unity" amps.

Other suggestions might be:

"Classy", definitely stretching the truth.

"Communications Concepts" kit amp, much more honest.

LOL, Hey Now I'll back off!!! I truly understand your dysfunction DUK,
Why did you not explain to everyone earlier that you rode in the backseat
with MAW, an PAW, going to ALL THEM'THAR KEYDOWNS riding on that BIG'OL MAUL
absorbing all that STRAY RF!!!

I really think it baked your noodle! here is a quote from a previous post
by you in this thread....

I ASKED:
>>Have you been to a Keydown??

DUK ANSWERED:
>>>not dirictally , i live near chicago , and have listened to a few on the
cb .
if i wanted to i very easiely could be in a key down

THEN DUK STATES:

>>> they braught up me going to keydowns

I'm amazed..... Truly amazed.....

Are you referring to signal Engineering, They made Cubical quads
Resembling the old Hy-gain Big-gun, I think they designated them Lighting
4, and six, they also made an electronically steerable array, and i think a
small quad.... If so they are still in Biz but ithink it is West coast
now..... They advertise in Popular Communications regularly and would
guess someone here on the NG could give you the contact info....

Hmmm, I would dis-agree, my radio Dead-keys @ .8 watts and swings 17 rms Bird Watts.... any SWR bridge I have will show an swr increase with Audio because of the difference in forward power, Now if i modulate the radio with a test-tone and check the SWR it will be the same as the unmodulated signal. Where an increase in Forward power exists it would seem quite understandable a need to recalibrate the meter exists.....
.

Source record: 36711

Hi, gang! In the past several months, several folks here have indicated an interest in the new Family Radio Service walkie-talkies. If you live in central North Carolina or western Virginia, here's a chance to test 'em....

On Wednesday, I will be driving along the route indicated below. I'll be scanning FRS channels 1 to 7 the entire time. If you are along this path, perhaps we can make contact, even if it's brief. We also will be monitoring CB Channel 19, with other channels by request.

73,
QRM2000

APPROXIMATE TIMES:
8:00 AM. Depart Raleigh NC along US64 West.

9:20 AM. Siler City to Greensboro via US421.

10:15 AM. Leave Greensboro on US 220 to Martinsville VA, and thence to Roanoke.

12:30 to 2:15 PM. Hanging out on Roanoke Mountain and Mill Mountain, looking for "DX".

2:15 to 3:00 PM. Interstate 81 to US 460 in Blacksburg VA.

6 to 6:30 PM. Depart Blacksburg. Taking Interstate 81 South to I-77. Should be on the shelf overlooking a wide expanse of North Carolina around 7:45 to 8:15 PM.

Return route is US52 from Mount Airy to Winston-Salem, thence I-85/40 to Hillsborough, and I-40 to Raleigh, with ETA 11:00 PM.

I posted a similar question here. Got some sarcastic remarks
and one or two who agree. Those, I expect, that cant talk
civil are the offensive ones you hear on the air. They don't
have the mental capacity to know better... always a few in
each crowd. I have learned to just grit my teeth!

As you said below this should generate a few irate comments
too LOL.

It is too bad, but that is life I guess!!??
Cheers,
John

On a 5 Pin Cobra mike you can not get audio with out the
mike installed.

Pin #1 is the first on the right of the key notch.
Here is the pin out...

PIN # MIKE CABLE LEAD
1 Audio lead
2 Audio shield
3 Receiving Control
4 Grounding
5 Transmit Control
Cheers,
John

Hi everyone,
If there's anyone out there who's communicating with the Atlantis space shuttle, I'd be very interested in talking to you. I work for an Internet TV channel called SpaceWatch.com, and we are currently in the process of making a show about how astronauts communicate with the Earth via Ham Radio. If anyone's communicating with Atlantis, especially if you're recording it, could you please e-mail me back at ciara@spacewatch.com, or cbresnihan@pseudo.com. I'd be grateful for any information at all.
Thanks,
Ciara.

As far a perceived sound goes:

Nonsense. SSB is different than AM in the fact that a under driven
SSB signal will make the operator sound choppy. A higher percentage
of the total signal will be cutoff with this SSB signal. This under
driven signal is a quick way to do a test on a amp to see if it has
any bias. Of coarse with this under driven signal you must find a way
to maintain the key up circuit.

> while I'm preparing it to install it on my bike?

Sounds like a little knowledge is dangerous, and in this case
someone with VERY little knowledge.

MOST mobile antennas require a ground plane to work correctly.
But marine/special purpose antennas are another story. A lot
of those are DESIGNED to work on fiberglass vehicles that won't
act as a ground plane. They should work fine. Well, as fine as
any mobile antenna works in the house. (These are usually a
1/2 wave design.)

But even then, a lot of the 'mag mount' antennas work 'acceptably'
just by setting them on the fridge or a heater. No, not well, but then
you just want something to jack around with, right?

> Next - any particular antenna recomendations to mount on my bike. I am
> more interested in receiving that transmitting? I like the honda look
> antenna that has a coupling that pulls up then the pole can be bent
> ove for storage. Know anybody that sell them?

Those 'pull and bend overs' are quite common. My UHF/VHF
dual-band antenna from Diamond has that integral to the design.
And Radio Shack used to sell that as a separate part that you
could put on the top of the coil. But I don't recall seeing them in
RS since they stopped carrying a wide selection of all the
antenna parts. Now they just carry the 'big' springs and mounts.
Back in the 70's, you could get all the individual pieces fairly
common, like the small springs, the coils, the whips, and even
the little adapters for foldover. You'll probably have to shop
around for the little foldover thing.

Hmm, you might try some of the aftermarket cycle places, like
Saber Cycle that specializes in Gold Wing stuff.

Just out of curiosity, why do you not have to check the SWR of a handheld CB ?

From what I understand a high SWR can damage the output stages of a transmitter, therefore how do handhelds get around this problem. Are the antennas manufactured to a precise length to make tuning unnecessary ?

Richard.

That is because the device is operating in class B. To make it class C
it needs to have a fixed bias voltage that biases it beyond cutoff, not
at cutoff.

You sound awfully jealous Ballsmoke....But he is right that is a used amp
and he is asking above new price..If you want to be an asshole and buy it do
like Rocky said to Appolo Creed, "Go For It" !

3038. Re: Value of Elite linear?

Newsgroup: rec.radio.cb
Date: 2000-05-23 00:00:00 UTC
From: pepper99@NOSPAM.home.com
Message-ID: <392a9360.584891399@news2.rdc1.on.wave.home.com>
Source record: 36745

>These are usually 400w units, used it would retail around $200, if you want to
>move it maybe $125-150.

Ok, thanks greatly for the info.. By the model number (5500) I was
thinking that it was a 550 watt unit, but perhaps this is the sideband
rating?

Pretty bad when I can't remember what the heck it was that I bought,
but I can hardly remember my own name somedays, so shouldn't surprise
me I guess.. :-) I'm kicking myself for losing the manual.

Anyone else have any other "price guesstimates" or additional
information to offer that I could place in the ad?

Mark, Oshawa, Ontario, Canada

these ones are only 6 foot in length, mounting wise they are on a half inch thread (but no ceramic insulator) so it is difficult to damage let alone destroy (but I have to admit to having done so when I put a .308 round right through one). For some reason most were/are made in an orange colour but I understand that they can be purchased in any colour you specify. Base frequency of the RFDS models is 2.020 MHz (with the wandering lead removed) so they should tune down even lower.

not a real good job of cutting and pasting the iron. I think the fact
remains that he won't post
a picture to prove Slapnutz wrong indicates he has something to hide...

A soldering iron laying on top or inside of amp or perhaps
a dollar bill under the amp or inside would be much harder to fake...

Dave walks into a bar and sees John sitting at the end of the bar counter with a great big smile on his face Dave says "John what are you so happy for?"

"Well Dave, I gotta tell ya... Yesterday I was out waxin' my boat, just waxin' my boat, and a redhead came up to me... tits out to here, Dave, tits out to here! She says "Can I have a ride in your boat?" I said 'Sure you can have a ride in my boat.' So I took her way out, Dave. I turned off the key and I said 'Its either screw or swim!' She couldn't swim, Dave, she couldn't swim!!."

The next day Dave walks into a bar and sees John sitten at the end of the bar counter with a bigger smile on his face. Dave says "What are you so happy about today John?"

"Well Dave... I gotta tell ya... Yesterday I was out waxin' my boat, just waxin' my boat and a BEAUTIFUL blond came up to me... tits out to here, Dave, tits out to here! She said 'Can I have a ride in your boat?' "Sure you can have a ride in my boat." So I took her way out, Dave, way out much further than the last one. I turned off the key and I said 'Its either screw or swim!' She couldn't swim!!, Dave, she couldn't swim!!!!."

A couple days pass and Dave walks into a bar and sees John down there cryin over a beer. Dave says "John, what are you so sad for?"

"Well Dave, I gotta tell ya.... Yesterday I was out waxin' my boat, just waxin' my boat, and the most desirable brunette came up to me... tits WAY out to here, Dave, tits WAY out to here. I had more wood than my boat does. She says "Can I have a ride in your boat?" "Sure you can have a ride in my boat. "So I took her way out, Dave, way WAY out... much further than the last two. I turned off the key, and looked at her tits and said 'Its either screw or swim!!'. She pulled down her pants.... she had a dick, Dave!!! She had a great BIG dick!!! And Dave, I CAN'T SWIM!!!"

3057. CB Antenna Questions

Newsgroup: rec.radio.cb
Date: 2000-05-23 00:00:00 UTC
From: mcyclemem@pipeline.com
Message-ID: <8gcu1f$t2r$1@slb7.atl.mindspring.net>
Source record: 36780

Was told over the weekend that I couldn't set up a mobile radio in the house with a Mobiler antenna - was told it would burn the radio up. I see in Radio Shack that there are at least two antenna listed as no ground - one for the window to roll up on. The other is a fiberglass/plastic mount. Can I use one of these to test my radio while I'm preparing it to install it on my bike?

Next - any particular antenna recomendations to mount on my bike. I am more interested in receiving that transmitting? I like the honda look antenna that has a coupling that pulls up then the pole can be bent ove for storage. Know anybody that sell them?

Thanks again for the help provided on my last post.

Dale

3058. Re: Question about Palomar 225 on SSB

Newsgroup: rec.radio.cb
Date: 2000-05-23 00:00:00 UTC

I bought that very amp and I am running it on my base station...I am using a Washington Base Station and have VERY good luck with the rig...Would buy another one in a heart beat!!! Talked ALL over the USA tonight on 38 LSB with it...using the Big Stick 1600 antenna as well

At 4 watts input I am getting about 125 watts output dead key and around 175 swing AM...just abit better on SSB...not official by any means....but it is what it is doing for me...

I am using a Astron 20 amp power suppy and it does really well on that..And Coax Kid shipped it pretty fast as well!!! Very pleased with the whole deal!

Now if only I could use my Palomar magnum 4500 HD amp in the house!!1 That thing kicks.. :) 'not a comp amp but clean and gets me everywhere I have a sweet 16 on the way!!!

Ron

629 Kansas City Moblie...38 LSB
PM 57 other places ;)

937 chicago

i have explained my self before to you an why i choose a biased amp . i guess i must again .

ther benifits of biasing incluse much better audio on am , but even much more on SSB , which i use alot . you need not drive it hard to get good results .

an x force is a high c class amp it is more a class b . and i have one unbiased , and had no complaints about the audio either . but i wished to upgrade , so i baught a bigger biased amp

Nonsense, if it can amplify an am signal without distortion it can also amplify an SSB signal without distortion. The amp dosen't know the difference between the two, they are both amplititude modulated signals.

I still say when reading swr of just the radio, with radio carrier at 4w, you should see very little movement increse due to forward power just out of radio. Coax, antenna, or ground problem.

>when you modulate are you recalibrating the meter this will throw it out of
>adjustment since when you modulate you are now doing more power ...

><Sticker> Elite Line Tx5500

These are usually 400w units, used it would retail around $200, if you want to move it maybe $125-150.

3075. Re: Davemade and 3 pill and magnum 257 questions.

Newsgroup: rec.radio.cb
Date: 2000-05-23 00:00:00 UTC
From: rollingradios@aol.com
Message-ID: <20000523004227.19758.00000741@ng-cp1.aol.com>
Source record: 36798

In testing done by Dennis Ostrowski, electronics engineer at Lucent technologies, he found that units using a single driver transistor tended to have much higher parasitics and harmonics over even numbered drivers or finals. This is why I recommended the class B biased unit with (4) 2290's. If you set your radio's AM output carrier to about 3-4w, you should get about 100-150w carrier out of your amp with around 500w PEP. If you prefer Dave Made products, I'm sure you can special order a class AB biased unit from them, I have no experience with Dave AB biased units. With your Magnum driving the (4) 2290's, you should get similar output as the 3 pill.

>Rolling radios,
>Why do you recommend an even number transistor amp?There is one other
>thing that I would like to avoid and that is the need for a driver.I

yes numbnuts is something a truth teller something you cannot do
pornfessor. A picture is worth a thousand words in your case it is
everything and you cannot provide one ... if you Slapdicks want to believe
the pornfessor you are more than welcome .. thats why on a whole CBers are a
bunch of losers .....

Richard Smith,
You can make any length conductor into a low SWR antenna
by using an impedance matching system. These matching systems
usually consist of some combination of coils and capacitors,
and are commonly called a tuner, if in a seperate enclosure.
If they're built into the handheld radio, they're usually
called 'Fred'.
'Doc

So what you are saying is that Dennis Ostrowski of Lucent technologies is condoning illegal amp usage and also manufacturing them?
Does lucent specialize in RF ? Arent they a Telecom giant?/ Any moron who knows how to use a HP Spec analyzer can do the same thing ...

?
"RollingRadios" <rollingradios@aol.com> wrote in message news:20000523004227.19758.00000741@ng-cp1.aol.com...

In a previous article, <bud60518@aol.com> writes:
>How do I know which length/kind of antenna for my moble CB?
>bud60518@aol.com
>

The formula for the length of a 1/4 wave vertical antenna is:

234/frequency in MHz = length of vertical element in feet

which is about 8 feet.

3083. Car Noise Reduction

Newsgroup: rec.radio.cb
Date: 2000-05-23 00:00:00 UTC
From: Richard Smith <rsmith@planeteer.com>
Message-ID: <8rxW4.534$qS3.1559@tor-nn1.netcom.ca>
Source record: 36856

Anybody have any tips for reducing car noise that is received on the CB ?

I am going to pick up a power line filter as a start. Should it be mounted in-line right before the CB power input, or at the start of the power cable run ? Or, should I splash out and have one at each end ?

Are there any other methods to suppress noise ?

Richard.

> 'Doc

AND..... if you'd like to try making your own 'beam' (Yagi) antenna out of wire... cut two more wires... one 5% longer and one 5% shorter (approximately) than the dipole's overall length and mount each about 1/4 wavelength (103 inches for 27Mhz) from the dipole (in the center). The longer one is the 'reflector' (back of the beam), the shorter is the 'director' (front of the beam). All this wire can be mounted between two trees along a center support rope (tying up the 9 ends can be a challenge, but they DON'T have to be completely horizontal... if the center is high enough, use ground stakes to form an inverted Vee Yagi.. try to keep the angle between the legs more than 90 degrees.)

Richard,
there have to be at least a hundred posts covering this
exact question on this NG. If you look back a few weeks,
you should see every possible suggestion in the world.
'Doc

3105. Re: Handheld CB's SWR

Newsgroup: rec.radio.cb

Source record: 36878

Richard,
Primarily because most 'real live' radios do have a
'Fred' that is standardized at 50 ohms. Most antennas
are also optimized for 50 ohms. And a tunable 'Fred'
costs more than the manufacturor wants to spend to make
their radios.
'Doc

Can't change the crystal. It needs an outboard crystal oscillator. It is here
that you would change a crystal.

Doc,

I know you already know this, but I thot I'd mention that dipoles rarely come out exactly on the desired frequency because of factors such as nearby objects, height above ground, ground conductivity, trees, and such. I once had a debate with a guy on a messageboard about this very thing. To him, "468" was sacrosanct, and would come out right every time. Can you believe it?

73

Jerry

Source record: 36892

Best to look the max. up in a manual (motor manual or
mfg. catalog). That 7 amp figure may be correct, but generally
the smaller auto alternators draw up to about 7 amps when rated
65amp or less and the newer 100amp models draw up to about
10amps. Even though the 270amp Leece is probably more efficient,
7 amps sound a little low. If you'd rather know the average draw
for typical outputs at given rpm, you will probably need to test
it.

>
> Thanks,
> Dave

If you're absolutely sure there are no opens or shorts
anywhere in the antenna system (system means plug, coax,
and the antenna itself), you've got a mistuned antenna
or an inadequate ground plane.

Whip type antennas (as opposed to fiberglass sticks with
wire wrapped around them) that are not 102" long have to
have some type of matching network to make them resonant
and a 50 ohm load. The matching network in your antenna
is likely to be faulty. A high SWR reading tells you
that something is wrong, but it's not specific. An antenna
bridge (aka SWR analyzer) that breaks SWR down into its
component parts (impedance, reactance, resonant frequency)
is needed for a more detailed explanation.

Most shortened whip type antennas allow you to adjust the
whip length. However, changing the whip length won't
correct large problems. Also, with mag-mounts, you have
to provide an adequate metal surface to act as a ground
plane. The coax shield is connected to metallic tape that
covers the magnet and comes in contact with the metal
vehicle body by capacitively coupling through the paint.
If the metal surface isn't large enough, or the capacitive
coupling isn't taking place, the SWR will be high even
though nothing appears to be wrong with the antenna.
In other words, there's your bad ground.

Most CB radio shops will offer to test and adjust SWR
for anyone who buys a mobile antenna from them. With
Radio Shack you're on your own. SWR is important enough
that all but the misinformed take the time to check it.

I hope this answers your questions.

I've been out of radio since about 1983, so forgive my ignorance......
Does anyone make/sell some sort of power combiner or matching
transformer that would allow you to use two or more individual amps as
one? IE: two 80watt boxes to get 160+

A one-driving-two with no bias (Class C) amp is
not a good choice for all-mode operation--it's
designed to be a little AM-only power bomb.

If you want to run SSB, have the amp custom built
to suit your need. By that I mean have it built with
an AM/SSB switch that bypasses the driver stage and
biases the output stage into Class B or AB in the
SSB position. Dave is probably the only CB amp
builder that'll tackle that--and it won't come
cheap--but it can be done.

An alternative to the above is to simply run a
straight 4-pill amp that's always biased into
linearity (Class B or AB) and has alot of gain.
The best in that regard is the Texas Star 500.
The only advantage the 3-pill will have is the
modulator effect of the driver stage. Adding
a switch to the Texas Star that kills the bias
will allow you to key low and swing high on AM
if that's what you're into. On the other hand,
the Texas Star is likely to cost less, is easy
to get (no waiting for a custom amp to be built),
and will work as well as the custom amp in your
application. I like the Texas Star from a re-
liability standpoint as well. It just makes
sense that 4 moderately driven pills will offer
better reliability than 2 overdriven pills--
especially when forward biased.

I'm not familiar with the 257, so I can't offer
an opinion on it. However, I am familiar with

the Midland 79-290. It's a small, detachable
face rig that performs pretty well and isn't
too expensive. When modified, it'll do 10 and
11 meters and produce 30 peak watts (it's a dual
final radio). That's enough to drive a Texas Star
500 to more than it's face value but not saturate
the shit out of it. In my opinion, that's how a
daily-use amp should be run. In other words,
drive it into the gain comressed region, but not
into total saturation.

Hehehe, I know what you mean. Funny though, I cut my dipole for 27 MHz with
that formula and did everything (tried at least!) as accurate to that formula
as possible, even though I know quite well that it's essentially a guide, and
open to the variables you mentioned.
But with only *minor * adjustments, on a magnitude of centimeters, it gave me a
nice 1.2:1 VSWR on the whole band. In my case, the numbers were awfully close
to optimum. I was expecting far more pruning and tuning than I actually needed.
But of course it's a fluke when these things happen, the formulae are merely a
good start, not a 'final answer'! :-)

I disagree. In my opinion, the 79-290
is a well built unit. A number of them
have been across my bench for mods, yet
not a one has been in for repair.

There is a downside, however. Some say
the receiver isn't a quiet as say a 2510's.
And, the radio will return to default
channel 9 if you cut the power to it
without first turning it off. That pisses
off people that like to hook the radio to
an ignition switched power source and turn
it on and off that way. In my experience,
those issues don't outweigh the radio's
overall value. Specifically, the receiver
isn't the finest available but is more than
adequate. And, in applications where an
amp is involved (like BTS111's), the radio
should be powered directly from a battery
and turned on and off manually in order to avoid
potential ground loops, RF feedback, and noise
pick-up problems.

You might want to stay away from the term
"RMS wattage." The purists will argue that
there is no such thing. To avoid that, use
"average wattage" instead.

On top of that, what you're saying agrees with
commonly accepted FCC and amateur practices;
however, if you were to research power measurement
and the related mathmatics you'd find a number
of very convincing arguments that disagree with
the "company line" that the FCC and ARRL take.

That amp is very similar to the Blue Face (Cobra, Galaxy, Magnum) 450.
I could be wrong, but they could even have been made by the same guy.
Those were/are very nice amps. They are full featured and offer a
fully regulated and adjustable bias circuit and output filtering.

As for its value, I would say it's worth 75% of what a new Blue Face
450 costs if it's clean, and 50% if it's not.

Same true for AM and class C prof, in class C the amp is biased BEYOND cutoff, not at cutoff as that is class B. There will be distortion because as the input waveform begins to rise it must reach a point to overcome the cutoff bias before the amp begins to conduct, therefore that part of the waveform where the device is not conducting is lost, yes that includes the part of the waveform that contains the sidebands which contain the intellegence. Also as the waveform falls in the negative direction and when it falls below the bias cutoff point, the amp stops conducting and the rest of the negative going waveform is also lost. So class C dosen't work for AM or SSB.

Dennis and I were discussing this at one point.
I was content that the company line was all there
was to it. Dennis convinced me otherwise. There
are a number of different power measurement techniques
and equations, all of which return different results.
Some of them return results that disagree with the
company line yet are just as scientifically based.
When a waveform is complex it's all about the details
and it can get more complicated than the company line
leads you to believe. Again, if you're interested,
I suggest you do some research on the subject. A
good place to start is with authors that are involved
with AC electrical systems (60 cycle and appliances).
All of this is of much more importance to them than
it is to us.

Lack of an RF (radio frequency) ground--usually
referred to as a "ground plane."

> Ok and if it is a lack of ground issue .... what do i have to do or should
> do ta fix it.....

Make sure the antenna mount provides a place to attach
the coax shield to a large piece of metal (like the
fender of roof of the vehicle) and that the connection
is mechanically and electrically solid.

There is a big difference between DC and RF grounds.
DC grounds can be moved from place to place using
wires. RF grounds can not--they have to be right
where the coax terminates (at the antenna mount).
So, if your antenna is mounted to a non-metallic
object or a metallic object of inadequate size,
you've found your problem.

On AM, there is no loss of intelligence with mild Class C like there is on SSB because no intelligence is conveyed at the crossovers. The distortion is still there, and some feel it colors the sound of the signal, but there is no actual loss of intelligence. Another way to put it is that the distortion is contained in the fundamental sine-wave (carrier) but doesn't seem to effect the sidebands.

Also, some mention has to be made of the degree to which an amp is biased into one class or another. The definitions sound clear, but there is alot of gray area between them when it comes to practical application. A CB amp that uses bipolar transistors without enough forward bias to cause some quiescent collector current is said to be Class C. However, with a normal input signal, the transistors are conducting over 97% of the time. That's far from "typical" Class C operation. It's much more like typical Class B operation. In other words, in a practical sense, unbiased CB amps act much more like Class B amps than Class C amps. That's why it's so often argued here that they produce useable signals on AM and SSB. Think about it. For communications purposes, 97% of the input signal being reproduced and amplified is as good as 100%. Alot more than 3% of the input signal has to be missing before the signal becomes unuseable.

3170. Help with CB purchase

Newsgroup: rec.radio.cb
Date: 2000-05-23 00:00:00 UTC
From: Pierre Lefebvre <plefebvre@biinfo.com>
Message-ID: <8gfadhhsq1@news2.ottawa.cyberus.ca>
Source record: 36943

I recently purchased a CB transceiver for my weekly road trips on a busy highway (1,000 kms or 600 miles each week). There is a lot of truck traffic on this highway and I thought it would be a good idea to hear about what hazards are ahead and to communicate any I encounter. I got a used handheld CB radio (Cherokee AH-27F) and a new antenna (Wilson 1000). The magnetic base antenna with 5 foot whip is installed on my trunk and plugged into the handheld unit (with a BNC adapter) which gets it's power from the cigarette lighter adapter. The unit sends/receives OK, but the noise between transmissions very loud and annoying. The transceiver also picks EM interference from my wiper motor and the ABS pump. With the ignition off, the transceiver still makes a ton of noise. I have played with the squelch and I can't find a less noisy setting. Is this normal or is anything wrong with the transceiver? I'm thinking of replacing the handheld unit with a regular one. I'm on a budget of course so I'm looking at the Uniden Pro 500 series but the Cobra also looks good. I want something I can easily re-sell later. Any recommendations?

Thanks.

PL

Power definitions that are used within RF work are well
defined. There is no company line that I know of.. What
is, is. Even complex waveforms can be expressed by using
the Peak formulas.

For simplicity sake all RF power measurements are
average power measurements. The only difference
between peak, average, and mean are the time
periods of measurement.

If there is a formula that goes against what you
call the company line, then I would like to see it.

Well lets see who is the dope now Professor, first time I called you
a name, how about that?

Lets look at your past posts.

1) You claim that when you add modulation to a carrier, the carrier
level increases. Wrong!!!

2) You also claim that a SSB signal has no carrier at rest, but has
carrier with modulation. Wrong again.

Now we are supposed to believe that you know about amps, AM and SSB?

I don't think so, your the dope this time, and many more times.

3176. Re: 102" Whip Antenna

Newsgroup: rec.radio.cb
Date: 2000-05-23 00:00:00 UTC
From: W5LZ <w5lz@oio.net>
Message-ID: <392B4369.1B6DD234@oio.net>
Source record: 36999

Jason,
First, I'm taking for granted that your 102" whip is on
a vehicle of some kind.
Do this, check SWR on ch-1, then on ch-40. Which is lower?
Are you using a spring on the whip? If not, it's going to be
too short, and SWR on ch-40 will probably be lower than ch-1.
Grounding is important, but if there were no ground the SWR
would be higher than 3:1.
'Doc

If your using a Spring you may want to remove it and see if it is any different, those big clunky springs have a woven ground strap in the center that usually won't last as long as the antenna..... if thats not the problem check what the other folks are saying.....

Also a little history would be nice, like is this a new install, new antenna, did it ever work properly?

that kind of deal....

Good Luck

3196. FS: Sigma IV "Toilet Bowl" 11 meter antenna

Newsgroup: rec.radio.cb
Date: 2000-05-24 00:00:00 UTC
From: Jon <toomuchstuff@pobox.com>
Message-ID: <EYTW4.28355$T41.688078@newsread1.prod.itd.earthlink.net>
Source record: 36963

Excellent, customized Spanish-copy version of the original Avanti/Antenna Specialists Sigma IV CB antenna. Much heavier-duty version than the original. Modified with extra overlap of radiator sections and heavy duty gamma match for high power. Antenna effortlessly handles continous feed of more than 1200 watts with no SWR problems and can survive undamaged in sustained winds of 50-60 mph. Used, but clean and ready to go- not a rebuild project. This was my personal antenna for a year back when I had a station set up. Contact me via toomuchstuff@pobox.com for inquiries, details, etc. These antennas, and the like are no longer available.

Asking $100.00 I am in the Van Nuys, CA area. The antenna can be disassembled and shipped UPS at buyer's expense.

Cap'n Crunch,
I'd make two changes with what you said. First, the
distance between elements would be about 0.12 wave length,
or about 4 - 4.5 feet (works out better than 1/4 WL).
And second, the angle between the legs of the dipole
and other elements of the beam should be closer to 120* or
more. When you add the director and reflector, the input
impedance of the dipole (driven element) drops from it's
former value to about half of that. If it was 50 ohms to
start with, expect an input impedance of around 20-30 ohms
after adding the other two elements. Reducing the angle
of the 'legs' from 180*, just makes this input impedance
even lower. You need to keep the 'angle of the dangle' as
large as possible.
Other wise, your absolutely correct......
'Doc

GrtPmpkin32,
We 'antenna experts' have another secret when dealing
with antenna lengths. It's called a 'fudge factor'. This
important concept is taught in electrical engineering
schools, but only in a special after mid-night session. A
number of special apparatus are required, the 'ritty-snitch'
being only one of them. The rest are too horrible to talk
about...

Yep, the prof posts from usenetserver.com, the above is from
bellatlantic.net. Hey prof, file a complaint with bellatlantic about
this character forging your usenetserver id and posting to usenet. You
can probably get him kicked off. Be sure and display full headers and do
a copy and paste of all the header info in your email to
newsadmin@bellatlantic.net

Sell them both and buy a DX500 or a 667V.

You can't combine them (different powers), and you can't drive one with
the other (well you can, but it will sound like sh!t. Can you say
"splatter box"?).

Richard,
Sorry 'bout that, I just couldn't resist. About the efficiency of a hand held. It seems like most hand helds are thought of as 'toys', and you just don't find much 'quality' till you really get up there in price. Thats not true in every case, but in general, hand helds are 'toys'. If you substitute the correct name instead of 'Fred', everything I said was true. I just changed the name.

Personally, I like the guy in Minneapolis who stumbles out of the bar at 1AM, tyhen comes home and locks down his mic on Channel 19. Fires up a big linear (you can hear the fans kick in as the signal rises by about 4 S-units), then starts to play KKK and white Aryan tapes. All he ever says is "KKK, the American Way"...then starts the tapes again.

You can make your own Wilkinson power divider /splitter out of 75 ohm coax. It is the same as a harness for cophasing two antennas but has a resistive load that absorbs out-of -phase power. I agree with doc though you should not do it. Two supposedly identical amps can have a considerable difference in gain and phase shift causing a lot of power to be dissipated by the divider or in the finals of the amps. You would really be fortunate if you could find two off-the-shelf amps that are matched close enough to use like this.

>later. Any recommendations?

The Pro500 will be no less "noisy" than the handheld. The least expensive radio
that has good performance in both transmit and receive is the Uniden PC68xl.
That is the least expensive radio I will sell to my customers.

Source record: 37024

You can record it yourself. Just tuner a scanner to 145.55 FM and use a squelch activated recorder switch. Orbits are approximately 90 minutes apart, and the length of a "communications window" ranges from 0 (orbit never crosses the horizon from you location) to 15 minutes (orbit goes directly overhead). SAREX equipped shuttle missions use a combination of voice and packet. Packet is automated and requires no intervention. Voice is on a schedule to schools (highest priority) and to Amateur operators in general (when work schedule permits and a school contact does not conflict.). You can use tracking software to determine when a pass is to occur and what the window is, but it requires your clock to be accurate, and kepelarian elements that are up to date. The keps are updated every time an orbital maneuver is executed, and on shuttle missions they can require updates to be made many times daily. The keps are used to predict where in the orbit the shuttle will be in any given moment in time.

For further assistance, contact AMSAT; www.amsat.org or the ARRL under the SAREX (Shuttle Amateur Radio Experiment) program.

Hope this helps some.

David
KD4NUE
Former AMSAT Member
Shuttle contacts on both Voice and Packet logged

Yep you ARE right, but i do get same results basically at any carrier level as the increase is more than nominal... I suppose some meters may be more sensitive to it.... I actually do have one meter wich will maintain a steady reading, its the Digital one sold by RadioScrap, but it resamples quite a number of times every second...

Bill Eitner <kd6tas@freewwweb.com> wrote:
: Dennis and I were discussing this at one point.
: I was content that the company line was all there
: was to it. Dennis convinced me otherwise. There
: are a number of different power measurement techniques
: and equations, all of which return different results.
: Some of them return results that disagree with the
: company line yet are just as scientifically based.
: When a waveform is complex it's all about the details
: and it can get more complicated than the company line
: leads you to believe. Again, if you're interested,

Peak power formulas work, regardless of the waveform - although most so-called peak power meters will only give an accurate reading for a sine wave input.

There is no valid formula for determining average power of a complex waveform (such as the voice waveform). Rough approximations can be made, but that is all. On the other hand, the average power can be measured rather easily.

>fully regulated and adjustable bias circuit and output filtering.

Ok, thanks for the info guys.

>As for its value, I would say it's worth 75% of what a new Blue Face
>450 costs if it's clean, and 50% if it's not.

Understood.. What did these units retail for new?

So, would everyone think that a fair asking price would be in the
$200.00'ish range? I'm in no huge rush to sell it, and am willing to
hold on to it untill the right offer comes along, so offering it at a
low price to sell quickly isn't a concern.

Thanx all.

3267. Re: Car Noise Reduction

Newsgroup: rec.radio.cb
Date: 2000-05-24 00:00:00 UTC
From: John Amero <" johnaNO§PAM"@island.net>
Message-ID: <392BB5B4.F3717E79@island.net>
Source record: 37040

If you are a handy man build this. If it is power noise you
will not regret it...

POWER LINE NOISE FILTER
Note if the car is in need of a tune-up this filter may not
get rid of much of the ignition noise.
Here is what you do. The filter I made measures 5" long x 4"
wide x 3" high.
Lets start with a rundown of parts:- 1- 2 electrolytic
capacitors 6500 UF each at 15 to 18 working volts.
If you can find one capacitor with 12000 to 20,000UF OK but
you may need
to adjust the size of filter box. Get the Capacitors
first
because the size varies and will determine the filter box
size. my to
capacitors measure 3.25" X 1" diameter each. They
should have
a mounting bracket.

1- 1 ceramic disk.047 pf 100 V Cap.(capacitor),1
ceramic 5 pf 100v cap,
2- 1 ceramic 180 pf 100v Cap., 1 0.5 mf cap, 1
electrolytic 5mf 50v Cap.
3- 1 1.2K Ohm 5 watt resistor
4- 1 0.5" to 0.75" ID ferrite core
5- 2 chassis mount SO-239 connectors like the type
the antenna hooks on to the back of the CB.
6- 1 chassis mount fuse holder
7- 18 feet of #14 wire that is used for winding
electric motors... "magnet-wire".
8- 5/8" X 5" (length of the filter box) soft metal
round bar.
9- 1 metal project box from Radio Shack. 5" x 4" x
3"; wider if the big capacitors are larger than I mentioned
earlier
10- 12v relay like they use for fog lamps
11- 2 thick PVC or nylon washers, 1.5" in Diameter
X 3/17" thick (May have to make)
12- 6" of thin 3/4" heat shrink you can get most of
the stuff at Radio Shack or your favorite electronic
surplus.

CONSTRUCTION
We need to make a choke out of the bar, motor wire, plastic

washers and heat shrink. Cut the 5/8" bar so that it and the 2 washers fit snugly into the _length_ of the box. Drill and thread each end of the rod to take a 3/16" or #12 bolt. This is to secure the choke to each end of the box. Heat shrink the full length of the rod. Secure the plastic washers to each end of the rod. Grove one of the washers to allow the first winding to come to the top of the choke. If the washers are thick enough you can angle drill for the wire on a angle... this makes a neat exit. Now neatly, tightly and uniformly wind the wire on the rod and from washer to washer, do not overlap wire. You should get _about_ 3 layers. With a 1.5' lead out of the grooved or drilled washer and a 6" lead from the top layer tape or heat shrink the core in place, making sure that the windings _do not_ come loose. Drill the box for the screws in the rod and secure in the center, bottom of the box as close as to the bottom as the washers will let you. The core should be no less that 0.5" from the bottom.

Over the grooved washer install the SO-239 chassis mount connector; on one of the 4 screws place a solder tag. This is the_INPUT_ so mark it. Install the large capacitor(s)... they should have a mount. Install the other SO-239 chassis connector (at other end) with a solder tag to... off to one side leaving room for the fuse holder to go next to it. REMEMBER YOU HAVE TO HAVE ROOM TO GET IN TO SOLDER LEADS AND LEAVE ROOM FOR THE LID AND SIDES SO THERE ARE NO SHORTS ETC.!

Using #12 automotive wire wind as many turns through the ferrite core as passable and connect one end to the center conductor of the input connector and the other to the choke lead. Trim leads for neatness. Connect the 5 watt resistor from the center conductor to the solder tag installed earlier. If you are using 2 large capacitors connect the positive post to the IN center conductor and the negative to the grounded solder tag. Use #16 automotive wire for jumpers. Solder in place. At the other end connect the choke lead to the center of the fuse holder lead, solder. connect a #14 jumper from the other fuse lead to the _OUT_ center conductor of the other SO-239 chassis mount connector. Also connect the other large capacitor positive lead to the center conductor and other to ground (the solder tag). To the center end (between the out center conductor or + lead) and fuse holder and connect the other end of the .024pf, 5pf, 180pf, .05mf and to ground; connect the 5mf electrolytes to the same way observing polarity. THIS FILTER IS FOR A NEGATIVE GROUND CAR IF POSITIVE REVERSE THE ELECTROLYTIC POLARITIES. Try to keep the wiring as short and neat as possible. To one of the screws of the choke attach about 14" of #10 auto wire using appropriate wire connectors. SOLDER ALL CRIMP ON CONNECTORS!

INSTALLING IN CAR
Using _#10_ auto wire run a lead directly from the battery
to a spot where the lead from the filter to the CB will NOT
be any longer than 2.5 feet. If you want the system to
operate with the ignition key install the relay in a convent
place. Attach the #10 wire attached to the choke screw to a
GOOD car ground and use as short a lead as possible. NOTE
#10 wire is used not for the sake of amps but to reduce RF
loops. Resistance is considerably higher at RF than DC.

CONNECTING CB TO FILTER
After the filter has been tested, we will connect the CB to
the Filter. For wire we will use RG8/u Mini or better yet
shielded #12 pair. Use as short as a length as possible an
keep this run away from other wiring, especially parallel.
Attach a PL 259 connector to one end of the RG8 and fix to
filter output. If there is room in the back of the CB AND it
does NOT disturb ANY wiring install a chassis mount SO-239
connector for the power in and mark RED well. If this is to
difficult then run the RG8 power line to the last 1.5" of
the power cord if it pugs into the back of the set, if the
cord goes through the CB then connect and solder inside.

TIPS AND COMMENTS
I have used this in a Blazer, Caviler, and Dodge Neon, all
have been kept tuned up. With out the filter I got some
ignition noise and severe alternator and windshield wiper
noise. All was stopped with this filter. I can't stress
enough the importance of the neatness of ALL wiring and All
automotive wiring other than the filter itself; use the
proper connectors and terminals and solder ALL connections.
Crimps only let in corrosion. Where there are bare wires
that may short use heat shrink. The RG8/u mini is to insure
the noise is not picked up between the filter and CB. This
filter is not heavy enough to run a large RF amp. or linear,
the "magnet-wire" would have to be #8 or 10 wire for any
thing from 100 to 250 watt.

Good luck and any questions... ask
John

A man goes to the confessional. "Forgive me father, for I have sinned."
"What is your sin, my son?" the priest asks back.

"Well," the man starts, "I used some horrible language this week and
feel
absolutely terrible."

"When did you use this awful language?" asks the priest.

"Well, I was golfing and hit an incredible drive that looked like it was
going to go over 280 yards, but it struck a phone line that was hanging
over the fairway and fell straight down to the ground after going only
about 100 yards."

"Is that when you swore?"

"No, Father," says the man. "After that, a squirrel ran out of the
bushes
and grabbed my ball in his mouth and began to run away."

"Is THAT when you swore?" asks the Father again.

"Well, no." says the man. "You see, as the squirrel was running, an
eagle
came down out of the sky, grabbed the squirrel in his talons and began
to
fly away."

"Is THAT when you swore?" asks the amazed Priest.

"No, not yet," the man replies. "As the eagle carried the squirrel away
in
his claws, it flew over a bit of forest near the green and the squirrel
dropped my ball."

"Did you swear THEN?" asked the impatient Priest.

"No, because as the ball fell, it struck a tree, bounced through some
bushes, careened off a big rock, and rolled through a sand trap onto the
green and stopped within six inches of the hole."

Silence filled the confessional until the Priest sighed and said,

"You missed the fucking putt, didn't you?"

COLD as ICE and TWICE as NICE.. Mr. ICECOLD BIG APPLE TREES says.. It don't
mean a THING if you ain't got that SWING!!!!!!!

Bill, I have openly admitted that some of the components used in my new amp
are from this business.
Maybe you'll tell us all just what kit from them you can buy to make my amp.
Look at the picture again closely and tell us...

I believe that the 2000 keeps the DC power supply actice even though the on-off switch has been moved to the off position. This allows for a constant DC source to power the clock. To keep this active... you must have the unit plugged in to the AC outlet at all times. Are you unplugging the unit?... or shutting off the AC power though a light switch?

Source record: 37058

When I wrote that message, the conditions were this:

Sunspots = 150
Flux = 204
A index = 17
K index = 3
Aurora = 5

Now the darn A index has went up to 53!! Alot more absorbtion now, so the conditions have gotten pretty bad over the last bit.

No Pro fesor, I ment Heat as in a lot of power, these noted combiners
will handle a lot of power.

The heat you speak of is I squared R loss, two different things.

Americancruiser,
The quick and dirty answer is , no. Combining the
output of two or more amplifiers is not a simple thing
to do, and unless there is some compelling reason to do
so, it's also sort of a very stupid thing to do. If you
want more power, buy more power. You hear lots of stories
about 'combining' amplifiers, but most of them are just
that, stories.
'Doc

The Blue Face 450s are available now. Here
are two mail order links:

http://www.xportsrus.com/Mobile_Amps.html
Here it's $250 plus shipping.

http://www.coaxkid.com/amplist.htm
Here it's $260 plus shipping. There's
also a picture of a new one on this site:
http://www.coaxkid.com/c450.htm

> So, would everyone think that a fair asking price would be in the
> $200.00'ish range?

That's a little steep unless it's like new.

> I'm in no huge rush to sell it, and am willing to
> hold on to it untill the right offer comes along, so offering it at a
> low price to sell quickly isn't a concern.

If it's clean and you can wait, there's
a chance you'll get $200 for it. The
only problem is how to advertise it.
Out here people know what things cost.
You'd be better off auctioning it off
or selling it locally if $200 is what
you're expecting to get out of it.

Source record: 37067

aurora was visible in iowa last night... i quote from
www.sec.noaa.gov/forecast.html :

IIA. GEOPHYSICAL ACTIVITY SUMMARY FROM 23/2100Z TO 24/2100Z:
THE GEOMAGNETIC FIELD WAS AT ACTIVE TO SEVERE STORM LEVELS. THE
TRANSIENT OBSERVED TO PASS ACE AT 23/1625Z HERALDED THE BEGINNING OF
A COMPACT AND COMPLEX MAGNETIC STRUCTURE. A NUMBER OF STRONG
NORTHWARD TO SOUTHWARD VARIATIONS IN BZ OCCURRED THAT REACHED
EXTREMES OF -36 NT TO +30 NT. CONDITIONS IMPROVED BY 24/12Z BUT
SOLAR WIND VELOCITY REMAINS ELEVATED RESULTING IN ACTIVE TO MINOR
STORM CONDITIONS PERSISTING THROUGH LATE IN THE PERIOD. THIS
ACTIVITY IS PRESUMED TO BE ASSOCIATED WITH THE C7/1N FLARE THAT
OCCURRED AT 20/0535Z.

i've noticed increased reception here as well with this crappy little
antenna that i'm borrowing until i can buy a decent one.

Hello Iron Dog: Are talking about a Cushcraft Ten Meter, 3 Element Beam Antenna?????

If you are, yes the antenna can be modified to work on the CB channels. The Elements must be made longer, and the element spacing increased.

You will need to have the assembly manual for the Cushcraft beam antenna, and compare it to the MaCo 3 element beam antenna, and make adjustments. Beam Antennas will work pretty well even if they are not dead nuts on all the measurements. The MaCo line of antennas are known good working antennas, with proven measurements. See:

http://www.majestic-comm.com/maco/support/index.htm

This is a absolute Treasure of CB Antennas, with the assembly instructions, you won't find this much info on proven hands on and working, in all the long haired books. That people will recite.

E-Mail me if you need more help.

I'm looking for suggestions on a good power mic (and
where to buy it online, if you happpen to know):

I've got a Midland 77-115 and an old (but dependable)
Wilson antennae. So far, so good. I'd like to complete
the set with a good, durable power mic with multiple
sound effect feature.

Ideas? Recos? Please drop me an e-mail.

HI

If you can I highly highly recomend you try to get an SSB/AM CB even if it is a used one.
You are authorized to use 12 PEP watts in SSB mode rather than the 4 watts in am mode, Also since your transmitting on the sideband you will have increased range.

<< With the amount of traffic
on the road these days, I believe that it could become an alternative to
CB. Lets just try to remember that this is a FAMILY radio and watch our
manners. >>

I was pleasantly surprised to hear how many stations were using FRS along the Interstate in Virginia. Much more than the last time I scanned while driving. However, I could not engage any of them in conversation--even while travelling the same direction and with good signal strength. One lady told her companion, "A trucker is trying to talk to us."

Nothing like a good assumption, even if false!

I had better luck from a vantage point 1,000 feet above Roanoak. The entire city was spread below me. I caused a "pile up" on channel 4. Everyone wanted to talk to me. Some were in the city, and others were 10-12 miles away. The key was announcing my location. Once I did, folks jumped in to make contact. I think it's so that they could brag to their friends how far they talked on the radio.

You can not use those three transistors interchangably without changing some other components. If you do only change the transistors... the amp may work but will probably have awful efficiency... maybe as low as 25-30%. The other components that need to be changed involve impedance matching.

I recent came across a device made by LLOYD'S. It is an AM/FM/40-Channel CB Monitor. The model number is N713. The device operates on either AC or DC power. Back and sides of case are made of a leather or vinal covered cardboard. Looks to be about from the late 70's? I can't find a date on it anywhere. Back cover flips upward, and when closed, is held in place by two straps with snaps on them. Device is in fair to good condition.

Anybody have any idea what something like this might be worth? Might anybody possibly be interested in purchasing it?

Thanks,
Power House - 823

Hi All,

I want to purchase a new MACO 5/8 Ground Plane and would like to
know who has the best price delivered to me in SW Florida.

I'm ready to buy TODAY so send meyour price.

Also, want to buy a newer crank up Tower, 30-40 ' tal.

Thanks,

Mike FL

3333. AMP - Tweak help NEEDED

Newsgroup: rec.radio.cb
Date: 2000-05-25 00:00:00 UTC
From: trout <trout1000@squonk.net>
Message-ID: <epnqis8r2fjm4fv2jk2g4j3qoa70lo494k@4ax.com>
Source record: 37106

I'm thinking about getting the 667V and need all help possible.

I'd like for it to be "improved" without killing the life of the AMP.

I've heard all speak of better PLL's.

What can be done to this amp and please explain the existing
parts and the ones used to replace them.

I'm not looking for higher power, I can always buy a larger amp,
I'm looking for a better performing amp.

Better caps, resistors, or other parts ???

All help is greatly appreciated.

3334. Callsign..???

No callsigns needed for CB radio... you just make up your own handle... to get a Ham Callsign, you'l need a license from the FCC... a simple written exam (for the technician class license) will get you started. Many here are Hams, and still involved with CB radio.. after all, radio's what we enjoy!

Practice exams are available on-line at http://www.qrz.com and several other sites. To take an actual exam you'll have to get in touch with your local FCC Volunteer Examiner group (fee for exam is $6.75, I believe). Go to W5YI or the ARRL online to find a VE group near you.

Once licensed (free), the FCC will assign you your 1st callsign (free)... you may then apply for a Vanity Callsign (what you can get is limited by your license class) at a charge of $14 (presently). Licenses are good for 10 years, and renewable without re-examination (Vanity calls have a renewal fee.. also $14, presently)

Callsign for Amateur radio requires you to pass a test then the FCC assigns
you one. For CB you don't need one to operate it here in the US.

You may have a bad solder joint somewhere in the power supply section
and when you turn it on, you are trying to get current that is not
there. You could also have a transitor or a capacitor going bad in
the power supply as well. Or you could have a bad (or leaky)
capacitor after your power switch so when you first turn it on, the
capacitor has to charge up. first, I would change the large capacitor
in the power supply section.

Pablo,
If you mean on the CB band, there are no call signs.
You just make something up.
If your talking about the ham bands, then your issued
a call sign by the FCC when you pass a test. After passing
a license examination, you can also apply for a particular
call sign, if it isn't already issued.

femaster1,
I'm not familiar with the device you have, but it
sounds like something from about that era. Most devices
like that are not exactly the 'best' performing things
you can find. Probably isn't worth 'useing', but may
have some collector value...

trout,
It isn't just a matter of replacing parts with 'better'
parts. In some cases it would require re-designing the
amplifier completely. I think you woould be better off buying
or finding an amplifier that was 'good' to start with.

A couple of years ago, we had an east wind for several days. The tide went
out on the Chesapeake Bay and didn't return for a day and a half. Boats
in the marinas were hanging by their moorings...

If your swr is ok there will be no problem, but as for antennas. In my moblie I use a Wilson 5000 and for my base I use a I-MAX2000 and I would never go back to a Antron-99.

if your looking for a cleaner better amp go with the texas star500. same number
of output transistors and less likely to see any problems. the only thing that
may be neccesarry to upgrade it is add a thicker power wire in place of the
ones in it. its a good amp.

Doc, agreed on the roof mount. Good point about the cell phone
antenna.

Jason,
Assuming you have modest metal working skills I'll suggest another
option. Driving through D/FW a while back a saw a pretty good setup on
an S-10 Blazer that might be of interest to you. The owner had
fabricated an antenna mount out of a piece of plate steel and fitted it
in the back liftgate jamb.

> is tuners? why is that?

I take fot granted that what you are calling a 'tuner' is
actually a tuned circuit on the output of the amplifier. They
are not the same things. Also, if there is no tuned circuit on
the output, it means that all amplified signals into the amplifier
and those generated in the amplifier are being radiated. Those
things are called harminics and parasitics, and are what is
usually called 'splatter', and are 'normal' for broadbanded, non-
filtered amplifiers.
Before people start having 'fits', I am not picking on 'Dave-
Made' amplifiers. Any amplifier made using this type output will
also be 'dirty'. Thats not just my opinion, thats physics. Don't
blame me, blame God for making it that way.

Very similar design too. My last post
to this thread describes the similarities
and states that your amp may very well
have been the predecessor to the amp
noted above.

Texas Star uses high quality parts, so that's not a problem.

I would get the 500 rather than the 667. The output is the
same in both amps, and getting rid of the driver stage increases
reliability.

I would get the R version rather than the V version since the
variable pot on the V is a common failure.

I would add a fan to the heatsink side of the amp. All the
Texas Star amps that use 2879 transistors run hot without a
fan.

That's about all there is to it. There are other mods floating
around, but they are aimed at increasing output rather than
increasing reliability.

I guess this seems a reasonable response along with Tim's.
I will need the variable power feature - long story.

The Texas Star 500HDV is what we are talking about ?

Hey Dave have you checked your lamp latley?
How about the cord going from the computer to
the monitor? Light switch? Nails? You would
would have to live in a grass hut to not have to
have something not made in China or a former
eastern block country.

The Landshark.

I have a Konel model KR-160 radio. I know nothing about it. I am
trying to find any information I can about this unit. Any help would
be greatly appreciated.

Thanks

hey 69 texas stars are junk my friend got a brand new galaxy 99 and a new
667V from cb world exit 109 off 95 . on my bird meter with a 500 watt slug .
the amp dead keyed at 300 watts and went back to 150 bird watts when i talked .
his antenna is a wilson 1000 roof mount . is there any help for his set up .
thanks 667 in maryland is out

3411. Limited Space/Indoor Antennas on eBay

Newsgroup: rec.radio.cb
Date: 2000-05-26 00:00:00 UTC
From: antenna_warehouse@my-deja.com
Message-ID: <8gkiu6$6pe$1@nnrp1.deja.com>
Source record: 37184

Hello,

I have a couple of different antennas for those who are in situations
that don't allow for big outdoor base antennas. They may be seen at the
eBay Dutch auctions below.

INDOOR BASE CB ANTENNAS $15.00
Ends 5/28 9:57 pm CST

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=338834675

NO GROUND BASE/MOBILE CB ANTENNA $29.95
Ends 5/28 9:25 pm CST

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=338788678

These are being sold in a Dutch auction, which means no worries about
being outbid at the last moment, or the price sky rocketing
because of bidding wars. You bid, you pay, you get one! If you don't
want to go the eBay route, no problem! Contact me direct.

Be sure to check our other auctions and website for other great deals
on Scanner, CB, and Amateur antennas.

Thank you

I would suggest that you check with the FCC web page to see if you can apply on-line. You will be issued a callsign for your GMRS license, however there is a fee required for the license, and they will ask for your taxpayer number/social security.

18 + 9 = 27 This dimension creates a greater possibility of having
a voltage maximum at the radio. It would be better to have a short
jumper or, if you can't use a short jumper then use a 18 foot jumper
instead of the nine. Ground both the radio and the amp if this is not
already done. If you have excess coax don't coil it into a neat
package. It would be better if it was loosely stored. Hopefully this
alone will correct the hot spots and hang ups. If not try adding a TVI
filter just after the amp.

A moderate jump in SWR with power is to be expected. Most swr meters
are less sensitive at the lower wattages.

> I assume that a Wilson 1000 will be close to 50 ohms at the antenna.

With a 50 ohm termination, you will have no voltage maximums.
Voltage maximums and minimums are created by the interaction between forward and reflected voltages. At 50 ohms, because there is no reflected voltage, the net voltage along the line will be flat and equal to the forward voltage.

It is a mismatch, some impedance other than 50 ohms, that creates a reflected voltage which, in turn, creates voltage maximums and minimums along the line as the reflected voltage interacts with the forward voltage.

As an example, a 40 ohm antenna will have a voltage minimum at the antenna and repeated every half wavelength. A 60 ohm antenna will have a voltage maximum at the antenna and repeated every 1/2 wavelength. Complex impedances (e.g. 55+j40, 45+j60) will create maximums at different points in the coax but neither is at the antenna.

In other words, voltage maximums (and minimums), can occur *anywhere* along a transmission line. While they repeat every 1/2 wavelength, their location is determined solely by the terminating impedance.

> >Thus, you can say how far apart
> >they are but you cannot say where they are unless you know the

I already said that you can say how far apart they are.
You can't say where they are.

If it is a toss up, then why are you telling him that he must not
coil the coax? Why are you giving advice that is bad half of the time?

You have never paid attention to SWR meters. Most if not all SWR
meters will read a lower SWR with a stock 4 watt CB radio compared
to the output of a clean SB220 The difference is a insensitivity
on the lower wattages.

>Some other parameter has changed if the SWR reading went up.

>power, you're gonna feel it.

Blah Blah..... But in the end he is looking for a solution to his
problem. he does not want to change amps or go without one. He
wants to find a way to use what he has.

This same setup no doubt is being used by somebody somewhere and they are successful. They are successful because some aspects of the operating environment are different. Like coax length, better grounds, different treatment of the excess coax. ect. ect.ect.

Solving these hang ups and burns is similar to solving a TVI problem in this aspect. You'll never know exactly what step, strep A, B C, or D solved the problem, but you have to go through the steps regardless before anything can be solved.

You are looking at this wrong. The antenna needs a counterpoise. It
could care less if it used the auto body or the coax outer shield. It
has no brain. It will use whatever is available. There is no doubt
that some current is coming down the line because it is being
induced by the near proximity of the antenna. 9 feet away from the
source it will be enhanced. 18 feet away it will be invisible.

snip

>If it is a toss up, then why are you telling him that he must not

Generally it is better not to coil.

You've given no reason for it to be "enhanced" at 9 feet away from
the source. You have no reason.

All you've said is that there is some current on the coax outer shield.
I accept that. Now, explain how the voltage maximums occur. And,
during the course of your answer, keep in mind that you will have to
use this explanation to answer the bigger question of how you, as you
claim, know where the voltage maximums occur. Good luck.

You've given no reason why it is better not to coil. Give us some
logic here (so I can "critique" it). ;-)

Easy

The 1/4 wave antenna is a current fed design. 1/4 wave away
from the feedpoint, or at the tip of the antenna is where the highest
voltage occurs. Elementary antenna physics.

This same voltage attempts to be mirrored on the counterpoise. And
because of this the coax shield at 1/4 wavelength away could also
contain a higher than desired interfering voltage.

"Now explain how" you don't understand. "Good luck"

A continuation:

Good luck on eliminating your problem. Take whatever steps that others
have suggested. Start with the easiest steps for you to accomplish.

Your setup is on, or just over the verge of self oscillating and
causing problems. Modifying just one aspect (the right one) could make
a difference between go and no go.

Hello Hamm 4 Fun: Yes I agree, a hole lot.

Hamm4fun wrote:
>
> The actual losses in a spliter /combiner should be only a few tenths of a db.

Yes I have measured the insertion loss and isolation of these spliter /
combiners, right at .1 to .2 dB insertion loss, about 30dB isolation
between ports. But of course being that the power is slpit, a -3dB is
seen, but not as insertion loss.

> About what you would expect from a BALUN.You can expect other losses attributed
> to loads, levels, and phasing not being exactly balanced. The better you are
> able to match these the less heating there will be in the splitter/combiner.

Yep good call there!

These spliters / combiners I have used in phasing antennas and such,
work great. Even with some SWR mismatch there still keep on trucking.
Had a two port spliter / combiner on a masr for over a year and it took
all the mud blood and beer.

No duh but.....Where's the solution? Throw the amp out?

The point is even though the amp is rich in harmonics, and may
be on the verge of self oscillating, you may be able to find a
way to change the environment and make it more hostile for
these oscillations.

Wouldn't these changes......coax length, grounding ect ect
be solutions?

I like the V feature. Sometimes barefoot ain't enough, and you don't need full blast. I can dial up exactly what I need. I don't need to be 10-8 for three counties when I'm talking 4 miles in heavy skip. That also helps to reduce QRM in the DX.

Have a good weekend everyone.

Tnom,
Any SWR/watt meter is only accurate over a particular portion
of it's scale. This is due, partly, to the characteristics of a
D'Avarsanal(sp?) meter movement common to most SWR/watt meters.
Thats also why these meters are made with various 'scales' instead
of just one scale. It keeps the accuracy of the readings fairly
constant. Another property of SWR/watt meters which will cause
some confusion at times, is that they are made for 50 ohm impedance
input. If the input is not 50 ohms, you can pretty well throw
accuracy out the window, all bets are off!
Sensitivity is not at question here. If anything, I would think
that the output of the amplifier, which is the input to the SWR
meter, is NOT 50 ohms impedance. This condition is common with
'broadband'/torroidal 'matched' amplifiers. It also is evedent in
that SWR changed (higher) with the amplifier 'on'. This kind of
input/output 'matching' is used because it is cheap. If it's done
correctly, it works well. If it isn't done correctly, what Hank
is seeing happens.
Some of us DO 'pay attention' to meters, SWR meters included....

tnom,
Self-oscilation is usually a 'self-curing' problem with
transistor amplifiers. The amplifier will turn it's self
off. If your quick enough, and have a bag handy, you might
be able to catch the smoke exiting the amp, so the 'tech'
can put it back in the transistors...

IT seems to me (as a former Radio Shack Emplyee) that some of their
handhelds used a 75 ohm antenna.
But, I've been wrong before.

>
> Thanks,
> Dave

If you're absolutely sure there are no opens or shorts
anywhere in the antenna system (system means plug, coax,
and the antenna itself), you've got a mistuned antenna
or an inadequate ground plane.

Whip type antennas (as opposed to fiberglass sticks with
wire wrapped around them) that are not 102" long have to
have some type of matching network to make them resonant
and a 50 ohm load. The matching network in your antenna
is likely to be faulty. A high SWR reading tells you
that something is wrong, but it's not specific. An antenna
bridge (aka SWR analyzer) that breaks SWR down into its
component parts (impedance, reactance, resonant frequency)
is needed for a more detailed explanation.

Most shortened whip type antennas allow you to adjust the
whip length. However, changing the whip length won't
correct large problems. Also, with mag-mounts, you have
to provide an adequate metal surface to act as a ground
plane. The coax shield is connected to metallic tape that
covers the magnet and comes in contact with the metal
vehicle body by capacitively coupling through the paint.
If the metal surface isn't large enough, or the capacitive
coupling isn't taking place, the SWR will be high even
though nothing appears to be wrong with the antenna.
In other words, there's your bad ground.

Most CB radio shops will offer to test and adjust SWR
for anyone who buys a mobile antenna from them. With
Radio Shack you're on your own. SWR is important enough
that all but the misinformed take the time to check it.

I hope this answers your questions.

So you are willing to bet that coax length, grounding, TVI filters
ect. ect. can't make this setup work better than posted?

Think again. This amp and others like it, operating with
probably no bias, with plenty of harmonics and no filtering can be
used with the right setup. It is not time to throw it away, yet.

So all the amps that are "CB no bias, no filter" should go back to
the drawing board because there is no way to run them without
getting RF burns and hang ups?

There is no doubt that the harmonics of a dirty amp will raise the
SWR. This is not generally of enough concern to incorporate bias and
filtering of CB amps. There are thousands of them that run just
fine without this. This persons amp CAN do the same with the
proper setup.

Of coarse there is a possibility that the output is not 50 ohms like
you said, but I doubt this is his problem. If he can hook the amp to a
dummy load with the SWR meter in line then he can confirm whether
or not the bad reading is from a bad output impedance. I doubt it is.

Take the time to check the SWR at various power levels and you WILL see that the indication will rise with more power. Sensitivity IS the question here. The poster of this thread has a bad SWR reading. Part from harmonics and possible oscillations, and part from the sensitivity flaw of the meter.

3462. Off topic: In flanders field the poppies.....between the crosses row on row...

Newsgroup: rec.radio.cb
Date: 2000-05-26 00:00:00 UTC
From: Redwire <graydogsNOgrSPAM@yahoo.com.invalid>
Message-ID: <10159966.ba3560ce@usw-ex0104-028.remarq.com>
Source record: 37235

This is off topic:

For those of us in the U.S.A. this is Memorial day weekend.
We hardly refer to it as Memorial Day anymore....because for too
many of us it is just a three day weekend, therefore, Memorial
day weekend instead of Memorial Day.(We have stipped it of an
actual "set" day.) I sadly suspect that about
30% of our population don't even know what is meant by Memorial
Day. When I was a kid in the early 50s the old folks called it
Poppy day and you would see old solders selling red poppies on
every corner to support disabled veterans. My mother always
bought one for herself and one for me. They cost a dollar each
and God that was a lot of money for us to spend back then. I was
just a little boy...it was only about 7-8 years since the war had
ended. One of my mother's brothers, my uncle, had died on one of
the pacific island landings. "He was killed before he made it to
the beach." she used to say. I had to grow up before I realized
why this bothered her so much, the fact he never made it to the
beach where he stood a chance of defending himself. Later, when I
was sent to Vietnam it damn near killed her.

So why am I telling you this? Because this week end there is a
good chance you will be around your relatives and if you ask I
bet you will find that you have a relative that died in WWI,
WWII, Korea, Vietnam, Gulf war.(memorial day in the USA
unoffically started after the civil war, by southern women who
honored the dead of both armys, north and south.) If you are in
a different country, it may be a different war and you may have
memorial day on a different day. It doesn't matter. The point is
if Memorial day is this weekend for you I dare you to at some
point in the long week end to ask everyone around you to remember
what the holiday is about.

I dare you to stop in the middle of your cook out, your lake
picnic, the Indy 500, (whatever) and say to your guests, "could I
have your attention, I would like to take a moment........."

PS. If you want to read the rest of the poem in the title of this
post it was written by Canadian John McCrae about the graveyard
in Belgium where American service men are buried from WWI. And
if you see an old guy selling paper Poppies on a street corner
this week end....please buy one, and wear it.

Ok, back to topic. (hey it wasn't so bad...it could have been
about who makes the best amp!)

While I partially agree with this post my best recommendation to you would be a Uniden Grant XL, it is not the cheapest (around $150.00) but it is a very good radio (it is not a handheld) and has a very good resale. As far as the problem with the noise, a good portion of that (or at least some of it) is that you are going through the Cigg. lighter for you power source. I would highly recommend running your power and ground from the battery! And don't forget the inline fuses on both leads. You can also install a noise suppresser in the positive wire, but keep it close to the battery or close to the radio, but after the fuse. This will help reduce any unwanted noise, but nothing will get rid of it entirely. Here is an example:

```
+ ------fuse--noise suppresser----------------------\
BATT
> radio
- ------fuse----------------------------------------/
```

You can use the original power cord and just remove the cigg. lighter adapter and then just connect the wires to it as shown.

Maveric

Your right, but the proper setup means filtering and proper design.
There may be 'thousands' of 'them' that work fine, but we're talking
about

this specific one that does not work right. There are no 'magic'
lengths
of coax that will 'cure' this problem, believe me!

> Of coarse there is a possibility that the output is not 50 ohms like
> you said, but I doubt this is his problem. If he can hook the amp to a
> dummy load with the SWR meter in line then he can confirm whether
> or not the bad reading is from a bad output impedance. I doubt it is.
>
Your right this time, and thats the easiest way of checking the
meter and the amplifier. I think your conclusions about impedance is
mistaken. One sure way to find out, just check it.

> Take the time to check the SWR at various power levels and you
> WILL see that the indication will rise with more power. Sensitivity
> IS the question here. The poster of this thread has a bad SWR
> reading. Part from harmonics and possible oscillations, and part from
> the sensitivity flaw of the meter.

I would say that the SWR reading isn't 'bad' at all, if it was
done
correctly, and if the meter is of average accuracy. Harmonics will
cause
the problems Hank is having, self oscilations will not. If the
amplifier
goes into self oscilation, the results are smoke and 'dead' transistors.
As some one said, SWR meters are not frequency dependent, they do not
respond to frequency. They do respond to directional voltages, and by
intergrating these voltages produce a reading of SWR. If the meter does
not respond appropriately to these voltage readings, it is either poorly
designed, misalighned, or broken. Not knowing what meter Hank has,
there
is no way of even guessing about how it is working. Until you know
differently, you have to assume that the meter is reading correctly.
I don't understand why you seem to think that the amplifier couldn't
be the problem. It is logical that it is. It's a fairly common thing
with amplifiers, and it isn't a 'reach' like SWR meter sensitivity.

snip
>Your analysis is flawed. The coax current does not work this way.
>It cannot mirror the antenna main element current as you describe.

The counterpoise will always ATTEMPT to mirror the whip. If the
coax on the car is induced and becomes part of the antenna
then a higher voltage will be at the 9 foot mark as opposed
to the 18 foot mark.

Here is a one mobile antennas manufacturers recommendation.
A quote:

****
Because of the imperfect world, we almost always recommend 18' (5.5m)
when our products are used. We do so with good reason too! At 18' the
voltage curve has dropped back to the zero voltage point where the
cable meets the antenna which reduces the reactance within the cable
itself (a null cable if you would). It has been our experience that if
the antenna location makes it somewhat out of sync with its
surroundings, cable lengths that are not multiples of our 18'
suggestion adds to the problem. To that, our complaining experts say,
"Then the antenna should be moved!" to which we say, "You tell the guy
with the $30,000 vehicle that he must drill a hole in his roof so he
can use a 9' cable". We solve problems in the best way we can
given the boundaries that the customer establishes.

On that note, when you have 18' of coax going to a radio that is only
8' away, what should you do with the other 10'? We recommend that you
serpentine it like a skein of yarn so that it is 10-14" long and tie
it in the center with a wire tie then tuck it away. Do not roll it up
in a tight circle as this can cause it to act like an RF choke, which
often times will cause system problems.
****

Do I always believe what I read? If it proves out in the real world,
then yes. This recommendations of this quote have in my experience
proven out to be the best scenario for a trouble free system.

Now, that isn't what I said, was it. I did say that to get rid of
harmonics/parasitics you should have adequate filtering on the output.
I didn't say anything about RF burns or 'hang ups'. Please don't
'muddy the waters' by putting words in my mouth.

I never said that. I gave possible solutions (even jimmy rigged
solutions) to the problem.

A solution is what the original poster was asking for. Redesigning or
replacing the amp is not a solution that the poster has to apply.
That solution would be like you telling a person to get a new car
because he is burning oil. There are other ways around this.
Even if they are jimmy rigged.

Thousands of crappy amps just like this one are out there running
flawlessly as long as other aspects of the installation are optimal.

> used with the right setup. It is not time to throw it away, yet.

I am saying that to 'cure' the problem, you have to go to the
source of the problem. If you want to 'spray' enough room deoderant
to 'cover up' the stink, you probably can. But the 'stink' is still
there, and you have not 'cured' the problem.
Harmonics are a problem because you get a false reading of power
output, you are producing a 'dirty' signal, your wasting the money
you paid for the 'false' amount of usable power, and causing
interference
on other channels (if not out of band). Who wants to pay for a 100w
lightbulb, and get a 25w lightbulb?

Hey I kind of like that guy. He always seems to have a load of sugar on that truck. And he has one of those voices that go well with CB radio. He always sounds so sincere. Like he really has a flatbed full of sugar he's hauling. I have to admit I have pissed him off several times with my "Bug guts" broadcast. Yes, I am the guy that is always asking for rain to wash the bug guts off my wind shild. He always takes offense because of his exposed cargo. Like he really hauls sugar on his flatbed. i wonder what he really hauls?

The coax shield is not a counterpoise. The car/truck body
is the 'other half' of the antenna (ground or counterpoise).

> "Now explain how" you don't understand. "Good luck"

Your right, I certainly don't understand why you persist
in this when you've been proven wrong. Guess I need the good
luck.

Hank,
The jump in SWR is the 'tip off'. Your amplifier does
not have a 50 ohm impedance output, or, it is filthy with
harminics/parasitics. Changing jumper length should have
no bearing on the change in SWR. The so called 'right'
jumper length depends on the specific coax used, and since
there is so much variation in coax of even the same 'batch',
it's almost impossible to recomend a specific length. Use
the length thats required, and don't worry about it. The
coax is not what is causing your problem. Neither is the
SWR meter. It's the amplifier. Good luck......

The handhelds have tendency to pick up more noise than a dash mount but the motorized devices will still be a problem especially the electronic fuel pump.
Skip levels are high and much of the noise you are hearing with car off is probably due to skip. It gets noticeably louder in the afternoon and early evening at least here in Chicago.
The recommendation for the PC68 or its processor the PC66 is a good one. Good sensitivity with a good noise blanker.
Check with your auto manufacture regarding fixes for RF interference from the fuel pump. Ford and GM have fixes available.
Look for Handy Andy on this NG he had a web site with good info regarding installation techniques and cures for noises.

3485. INVITATION TO 3 ANTENNA REFLECTORS(LISTS)

Newsgroup: rec.radio.cb
Date: 2000-05-26 00:00:00 UTC
From: fractenna@aol.com
Message-ID: <20000526091733.19076.00000159@ng-cs1.aol.com>
Source record: 37258

QST--

You are invited to join one or all of the following lists on onelist. All these reflectors are e-mail based, and moderated so that no spam, porn, off-topic, or personal-offensive posts are sent out. You will receive no off-list e-mails by subscribing: again; no spam.

These lists (with average recent subscriber sizes) are:

ANTENNAS@ONELIST.COM 200 members
CROSSFIELDANTENNA@ONELIST.COM 75 members
FRACTALANTENNA@ONELIST.COM 250 members

Please review the descriptions at

http://www.onelist.com

Please note the CFA list specifically deals with this antenna in an objectively critical fashion and no posts will be allowed that make grandiose claims without supporting data presented. To date, no data has been presented which requires the extraordinary claims made by some pundits: there is no evidence for better performance than any other small vertical antenna (and that performance is poor).

To subscribe to any list, either go through the process at onelist, or to skip the process just do:

---------- -subscribe@onelist.com

where the ---------- is the name of a given list (such as 'fractalantenna')

73,
Chip N1IR

First of all, it don't impress me by you using my last name.What do you think that scares me? Second, I don't give a Fxck about you! If this is all you have to concern yourself with is when my posts go up well that's pretty sad , don't you think? Why not concentrate on more important things going on in your life if there is any. I am sure that's highly doubtful. You probably weigh like 450 pounds and all you worry about is where is your next meal. Have a nice day FATBOY !!

I was just wondering how many of you out here on the newsgroup really own CB Radios? Do you people come out here cause you have nothing better to do with your time? I listen to some of you out here and I think to myself Gezzz what a bunch of dopes. I started my timer I want to see how long it takes for one off you monkeys to respond to this. I'll give it Hmmm, 5 minutes

Nice use of proper grammar. I usually don't use the persons
"Handle" either on the air or when responding to messages.

>Second, I don't give a Fxck about you! If this is all

Gheez Richard, you really should calm down a little. Your building
quite a reputation for being pretty irrational. I love the comment about
the weight factor. It just goes to show, you can't trust anything
someone sends you via e-mail

Yeah.right. Currents can never flow on the outside of coax.
Hot spots at odd multiples of 1/4 wavelengths are imaginary.
So are the burns.

a sweet 16 by texas star wasnt designed for that high voltage. if he says it
will run 18 volts all day then its more closer to a dave made or something like
that that is class c and probably wont sound as clean as a real sweet 16
especially on sideband.

Some of the I-MAX's are weak at the first joint. The weak one will tear out of the fiberglass if held horizontal prior to or during install. Solarcon is standing behind these antennas and replacing them free. Just test it first by holding it horizontal to make sure the joint holds...

That's why I'm asking. My SSB would be cleaner if I had no driver. Not like I sound bad, but I try for broadcast quality. <G> I hate to hear "10-9" when it's directed at me.

> 'Doc

I agree that the harmonics are the problem. This is a very
common scenario with a power amplifier.

While the SWR at the fundamental frequency has not changed,
there is now a significant amount of power at other frequencies
where the SWR is not good. Thus, the power at these frequencies
is reflected at the antenna. The SWR meter is not frequency
selective; it shows all power regardless of frequency. Thus,
it now shows a higher percentage of reflected power because
your signal now contains a higher percentage of harmonics.

> Hot spots at odd multiples of 1/4 wavelengths are imaginary.
> So are the burns

W5LZ did not say that currents never flow on the outside of the coax but he was probably correct to rule out these common mode currents in this case. The original post said "when i have the box off the swr is near flat." Since he had a good match, it is pretty safe to say that he did not have a common mode current problem.

> a voltage maximum at the radio.

There is no way to support this claim. Voltage maximums occur 1/2
wavelength apart; where they occur is determined by the impedance at
the end of the transmission line. Thus, you can say how far apart
they are but you cannot say where they are unless you know the
terminating impedance -- which you don't.

> It would be better to have a short
> jumper or, if you can't use a short jumper then use a 18 foot jumper
> instead of the nine.

Again, there is no basis to this claim.

> If you have excess coax don't coil it into a neat
> package. It would be better if it was loosely stored.

I can't agree with this either. In the absense of common mode currents,
coiling the coax has no effect. When common mode currents exist,
coiling the coax helps impede those currents -- which is good.
There is no reason not to coil the coax.

> Hopefully this alone will correct the hot spots and hang ups. If not try
> adding a TVI filter just after the amp.

Now you're talkin'. I support the TVI filter suggestion.

> A moderate jump in SWR with power is to be expected. Most swr meters
> are less sensitive at the lower wattages.

It's not the meter sensitivity; it's the harmonics.

No they're not.

> my friend got a brand new galaxy 99 and a new
> 667V from cb world exit 109 off 95 .

667s are for regular CBs like 148s--that's why they
have the driver stage. 500s are for high-drive radios
like 99s.

> on my bird meter with a 500 watt slug .
> the amp dead keyed at 300 watts and went back to 150 bird watts when i talked .
> his antenna is a wilson 1000 roof mount . is there any help for his set up .

The dead-key drive (input) power is too high,
and he might be starving it.

Reduce the dead-key drive until there's no
backswing with modulation.

Replace the stock DC wires with heavier wire and
bypass the fuses. Use a 100 amp fuse or (prefer-
ably) a heavy relay at the supply end of the DC+
wire.

Test for voltage drop with the amp keyed. Shoot
for no more than a .5 volt difference between the
amp keyed and amp unkeyed conditions as measured
at the ends of the heavy DC wires inside the amp.
If the voltage drop is more than 1 volt, something
isn't as good as it could be: the wire is too
thin or of low quality; the connections are resis-
tive; the voltage regulator isn't seeing the load
and stepping up the alternator output to compensate.

Make sure the 99 has been tuned for maximum peak
power. It should make 30 peak watts and hold 10
(no backswing) on an average-reading Bird.

Add a fan to the heatsink side of the amp. Set
it up to blow down into the fins.

These tips should get you to 600 peak and 200 Bird
watts with no backswing.

Hi there,
Don't worry about the wax, that stuffi s supposed to be there. It
removes heat and does not conduct electricity. What ever you do do NOT
scrape that stuff off. I have seen many a UK CB 27/81 rig destroyed in that
way.
As to the problem, not sure. If I find anything I will post it.
Cheers

> What stops you from a custom built 5 pill amp, such as an X-Force X-400?

The XT-400 is a popular amp that'll run rings around
a stock Texas Star 500. The problem is they're
expensive, lack features, and are not biased into
linearity for SSB use.

It depends on what the customer intends to do with
it. Even a straight 4 from X-Force will be well over
$400 by the time you add bias and a SSB delay switch.

Just because comp amps are available that doesn't mean
they are for everyone.

As I remember, they are called DX-500R and DX-500V;
the V is the one with the variable pot that fails
if it's not left in the fully clockwise (zero resis-
tance) position.

I've never seen a situation where someone had to have
the V type. The DX series amps are biased--they are
not modulators. Turning the variable pot counter-
clockwise from maximum reduces the peak power right
along with the dead-key power. It's much better to
set the radio's dead-key power to match the amp so
the amp can run wide open and produce maximum peak
power. I've never seen a situation where that couldn't
be done.

Hi there,

As you may have found out, the remaining SBE Company wants nothing to do with their checkered CB Radio past history. There aren't many people around who can service them without a diagram and really no places with parts other than generic cross from standard items.

You need to find a good tech with some photofacts of the radio your trying to fix and hope it's nothting special wrong with the unit that a generic cross won't fix.

To fix my faithful SBE Sidebander 4 (or IV), I had to buy a dead unit at the flea market to get the parts I needed. This was because the original / previous owner tried to do a frequency mod and trashed the unit.

This is the type of thing you often run into... they ain't making them anymore.

cheers
skipp

The actual losses in a spliter /combiner should be only a few tenths of a db. About what you would expect from a BALUN.You can expect other losses attributed to loads, levels, and phasing not being exactly balanced. The better you are able to match these the less heating there will be in the splitter/combiner.

If the Wilson 1000 is a mag-mount, permanently mount
it to improve the RF (radio-frequency) ground. There
is alot of RF (radio frequency energy) flowing and
trying to radiate off of anything that's at DC ground.

The amps you have tried are both extremely unstable
in your application. Much of that could be because
of a poor RF ground. The rest of it is likely to be
caused by the amp design. Many low-cost 2-pills have
no negative feedback or any internal adjustments that
can be used to tune for increased stability.

The difference in SWR readings between amp-off and
amp-on is a rough measure of amplifier instability.
As soon as the SWR reading passes 3:1, the instability
is so bad that the keying circuit will start to hang.
That tells you that something has to be done.
Playing with coax lengths could improve the situation
enough to where the keying circuit may not hang, but
the other symptoms will still be there. I suggest
you seek out a tech who's good with amps and can
clean up the design of one of your amps so it's not
so unstable in a dense RF field.

Your choice of radios can be part of the problem too.
Some radios become unstable when used in a dense RF
field and/or with unstable amps. The high-power
units like 2950s, 2510s, Galaxy 88s and 99s, etc.
are the most likely to add to the problem while

straight CBs like 148s, Grants, 29s and 76s, etc.
are not. The export President Jackson uses an
MRF477 final transistor just like the 2510. The
477 is a high-gain power transistor that's far from
being the stability king.

In a nutshell, your system is made up of parts that
are either causing or reacting to instability.

You've got my statement out of context. I said he didn't have a "common mode current *problem*" and it was safe to rule out common mode currents for the issue at hand -- an SWR reading that goes up when a power amp is turned on. I didn't say that he had no common mode currents. I even pointed out that W5LZ did not say that currents never flow on the outside of the coax.

Common mode currents cannot explain an SWR that goes up simply by increasing the transmitter power. The antenna system consists solely of linear devices. The impedance is not a function of the power. A different power level, alone, will not change the SWR. Some other parameter has changed if the SWR reading went up.

The SWR was good with the amp turned off indicating that the antenna system was operating as designed. This further suggests that the common mode currents were small compared to transmitter output current. In this case, the common mode currents are some small percentage of the transmitter currents. So, when you crank up the transmitter power, you're gonna feel it.

Unbeleivable! Typical 'techno-babble' which doesn't tell you one
single thing, other than that the advertisement division, rather than
engineering division, is writing the technical papers.
What they are trying to tell you is that an electrical 1/2 wave

length
of feed line will present the antenna's input impedance to the radio's input. Which is true. what they don't tell you is that an electrical 1/2 wave length of feed line is NOT always the same physical length. It depends on the velocity factor (vf) of the feed line. Some coax has a velocity factor of 66 percent, others up to 98 percent. This is a 32% difference in 'vf' and can be over 6 feet of difference in feed line length. RG-8, RG-11, RG-58, and RG-213 all have a 'vf' of 66%. RG-8x, '9913', and LMR400 have a 'vf' of 84%. If you 'do' the numbers, you'll see that an electrical 1/2 wave of any of these is not 18 feet.
There still ain't no 'magic' numbers!

First, try changing to a different power source and see if it gets
any better.

I would put the noise filter at the source right after the fuse.

You can also try resistor plugs and wires.

Extra grounding straps on the body parts sometimes help things out too.

Richard Smith wrote in message <8rxW4.534$qS3.1559@tor-nn1.netcom.ca>...
Anybody have any tips for reducing car noise that is received on the CB ?

I am going to pick up a power line filter as a start. Should it be mounted
in-line right before the CB power input, or at the start of the power cable
run ? Or, should I splash out and have one at each end ?

Are there any other methods to suppress noise ?

Richard.

Coiling coax is and old ham trick to reduce RF ingress /
egress on the coax shield. Never the less at the radio and
antenna the current and voltage should be 0 on the shield IF
everything is installed and grounded properly.

The tx signal highs and lows can be calculated. the Voltage
and current are 90 degree out of phase. See... any book on
antenna and coax characteristics or
http://members.tripod.com/cb_antennas/index.html
http://www.iserv.net/~codyspc/coax.htm

Cheers,
John

I think the best answer, assuming that the all of the rest
of the installation is done as suggested in various posts,
is a TVI filter in and out.

If you have a strong second harmonic the antenna is so far
off resonance that the reflected wave would definitely be
enhanced as power goes up. Your finals will be dissipating
this power!
Cheers,
John

If harmonics are the problem, a low pass filter is the answer.

Your description of antenna current is correct; your description of coax current is wrong.

Current is minimum (and voltage is maximum) at the tip of the antenna because, since the conductor stops there, no current can flow beyond the tip of the antenna. I think we all agree that this makes sense.

But just to expound on this, let me describe it from one more perspective. Current travels up the antenna main element like it travels through a coax. At the element tip, the conductor stops so the impedance is infinity. Similary, an open ended transmission line would have an infinite SWR with maximum voltage and minimum current at the open end.

But the shield of the coax is a different story. At 1/4 wavelength from the feedpoint, there is no reason for the current to go to zero. The conductor keeps going and so does the current.

Using the transmission line analysis, there is no open at 1/4 wavelength from the feedpoint as was found on the antenna end. There is no reason to expect a voltage maximum at this point.

Your analysis is flawed. The coax current does not work this way.
It cannot mirror the antenna main element current as you describe.

I'm a lucky guy. ;-)

Just as an audio amp can with a little help feedback, so can a dirty
RF amp. It can of coarse totally feedback and fry as you say, but it
doesn't necessarily automatically have to do this.

I actually had second thoughts about using the word flawless.
I anticipated a possible dispute over the meaning of this word.
So to elaborate a little more, the definition of flawlessly in this
case would have to have an asterisk.

> 'Doc

Thank you, Doc! Reading this thread at midnite, I was wondering when someone would mention velocity factor. To those of us who remember antennas pre-coax the length trick is an oldie and moldy but open wire has a velocity factor so close to 1.00 that vf was not even dreamed of. The biggest reason for the 18 feet in coax length is to be sure that nothing approaching a voltage or current node appears at the SO239 (that's the coax connector on the back, son).

The problem the man is encountering is, as you point out, even harmonics coming back from an antenna that doesn't match for diddly at 55 and 110 MHz. The scary part is that the antenna may well be matching gloriously at 82 and 138 etc and doing a real number on Channel 6 and some airplanes.

The only cure is a decent lo-pass filter in lieu of a BMFH applied with skill and gusto to the amp. Find an old B&W at a hamfest.

It being late, I just thought of another good use for 18 feet of coax. If you put a couple of good sturdy straight pins an ELECTRICAL quarter-wave apart, the resulting stub doesn't hurt the receive much but does a real job on transmit; the victim can't talk across the street. Now 9 feet times the .66 vf of RG8 gives 6 feet. Having 18 feet of coax available makes this just a whole lot easier to hide. Even gives the poor dolt a 1:1 VSWR. Time

for bed!

And if parallel current was more than a minor part of the problem you might
have a point. The energy being reflected is not at 27.5 MHz, it is at 55,
82.5 (unless he has a 9ft whip), 110 MHz, 137.5 where the whip is at least
now radiating more or less straight up, and 165 etc. The magic 18ft
half-wave is still a multiple half wave but if reflecting the impedance of
an end-fed Zepp back to the transmitter (and that is what a 9ft whip is at
55MHz) is what you want to do, by all means locate the voltage nodes at the
transmitter. A mad harmonic generator SHOULD suffer for his sins; the more
RF burns the better.

Is there some kind of 'Real Men don't Use Lo-Pass Filters' at work in this
thread???

Dick McCollum

tnom@mucks.net wrote:
:
: Here is a one mobile antennas manufacturers recommendation.
: A quote:
:
: **********
: Because of the imperfect world, we almost always recommend 18' (5.5m)
: when our products are used. We do so with good reason too! At 18' the
: voltage curve has dropped back to the zero voltage point where the
: cable meets the antenna which reduces the reactance within the cable
: itself (a null cable if you would). It has been our experience that if
: the antenna location makes it somewhat out of sync with its
: surroundings, cable lengths that are not multiples of our 18'
: suggestion adds to the problem. To that, our complaining experts say,
: "Then the antenna should be moved!" to which we say, "You tell the guy
: with the $30,000 vehicle that he must drill a hole in his roof so he
: can use a 9' cable". We solve problems in the best way we can
: given the boundaries that the customer establishes.
:
: On that note, when you have 18' of coax going to a radio that is only
: 8' away, what should you do with the other 10'? We recommend that you
: serpentine it like a skein of yarn so that it is 10-14" long and tie
: it in the center with a wire tie then tuck it away. Do not roll it up
: in a tight circle as this can cause it to act like an RF choke, which
: often times will cause system problems.
: **********

This just goes to show that some manufacturers do not have the slightest idea what they are talking about. It is no wonder that so many CBers and Hams are confused about antennas and transmission lines - given all the misinformation, such as that above.

Here is one point to show that the above is a bunch of garbage. Where the voltage/current nodes appear depend on the electrical length of the transmission line - NOT the physical length. If the above were true, then they would have to specify the exact type of coax to use.

Now, a 1/2 wavelength of coax may be desireable, if you wish to see the antenna impedance at the input of the coax. Then again, that may be the last thing you want - especially if the antenna impedance is not 50 ohms.

: Do I always believe what I read? If it proves out in the real world,
: then yes. This recommendations of this quote have in my experience
: proven out to be the best scenario for a trouble free system.

Just because a claim seems to match with real world experience does not mean that the claim is correct. For example - I could claim that the Sun is just a big pile of burning coal. Real world "experience" would seem to back this up - as it produces a lot of heat. In reality, we know that no such burning process is occurring.

The outside of the coax is not supposed to be part of the counterpoise. If it is, then there is a problem somewhere - and that problem may be in a lousy antenna design. As it is not a part of the counterpoise, there should not be any currents on the outside of the coax. Given this, then you want current chokes on the coax - not avoid them like the manufacturer recommends. By the way, the "skein of yarn" method recommended also forms a choke. And such chokes do not affect the currents on the inside of the coax.

boy redwire, it makes you wonder why anyone was willing to sacrifice their life for such a place as this. my uncle was killed in the normandy invasion. people back then just accepted such things. oh well, if i was a german or a japanese person, i would have asked myself what the heck i am doing in a foreign country. but it is nice to know that many lined up to give their lives for a country such as ours. where would we have been if many had decided to avoid the draft and go to canada. i guess we would have negotiated a peace with this brutal dictator, hitler. oh well. and he would have attempted to destroy the seed of the most High, the Semites. and he would have failed. but it was our destiny to defend it. so be it. we seem to always be the ones to be called upon to defend someone else's homeland. the world's policeman. is it time for us to crawl in our shells? sometimes i wonder. buchanan is wrong, no doubt about it. we must defend the world whenever called upon. it is our destiny,.....cd is out.....

Lets see, Mr. Webster says that 'flawless' means with out flaws;
perfect. With that in mind, your saying that an amplifier can be
a 'crappy' amplifier, have harmonics, parasitics, soound like crap,
and splatter the whole band, but by CB standards it's perfect. Are
you absolutely sure thats what you wanted to say? Wanna buy another
vowel... I mean astrict?

492 divided by frequency in MHZ gives you a half wave in free space.

Because wire antennas are supported at both ends you get something called end effect which is a small amount of capacitance added by the insulator. When this is taken into account you replace 492 with 468. It's a tried and tested formula that will get you close enough to require just a little trimming.

Sources :
"The Radio Amateur's Handbook" 1980 and also "Radio" 1968
(so it's not exactly a new concept then :-)

One of my favorite forms of wire antenna is the inverted V.
I used to have one of these in my loft. It costs pennies to make and It will perform as well as any non-beam antenna you can buy at any price (so much as really makes no difference when you think about the difference in cost :-) . . .

Make a wire dipole, suspend it from the center (i.e. where the coax connects). Stretch the ends out to make an angle somewhere around 100 degrees but definitely not less than 90 degrees and not greater than 120 degrees. You'll probably need to trim the ends a bit more than a regular wire dipole. The great thing about the inverted V antenna is that it behaves just like a vertical.

(I'm no egg head, I don't know all the answers and I get all my info from books. It it works for you then great.)

John,
Exactly what does antenna resonance have to do with the
second harmonic, or any other harmonic? They aren't caused
by the antenna.

If you can't figure it out with the built in freq. counter and the channel led then you need to go back to running cobra cb's.

Doc, finally some one is thinking!!!! You are the only one except me in a past post that has considered the velocity factor in coax!!!!! When you take in the velocity factor of, say, RG 8 with a velocity factor of 66% a 1/2 wave length is 12.02667 feet at 27 Mhz... a long way from 18 feet!!?? If you forget the velocity factor then it is 18.2222 feet at 27 Mhz.

Now when you try to mickey out a problem, there that type of thing is the only option one could go in circles for ever.

As I said before and mentioned on the opposing post here the best feed to an antenna is where the voltage is already at 0 and current at maximum in the coax (1/2 wave length), by virtue of wave propagation in basic coax physics.
Cheers,
John

Also remember that the SWR will (although not a receive thing) will effect
the amount of noise you are receiving. Especially those pesky little noises
that your vehicle likes to emit.

Make sure it is as good as it can be. It won't take it away, but lower the
dB of the noises being transmitted.

A good test is to disconnect the antenna from the radio and see if the noise
goes away. If it does then its coming through the antenna. FR noise. If
it is still there then it is coming through the electrical. This can save a
lot of money in filters if you trouble shoot it right.

A Side band radio is a good radio if you are going to use Sideband. If you
are not going to use side band then an AM radio will suit your needs. Just
look at the features. They are all good radio's if they have a good
antenna.

Good luck.

Debbie

Exactly, that is why coiling is better... it acts as an RF
choke on the coax shield, reducing any possible RF ingress.
Cheers.

The problem that is described is a bad solder. As the radio heats up the solder comes back together. Cold solder is a joint that looks dull. Or you can't see it at all. Most of the time you will find your offending solder in the waxy area. This is because as the radio becomes warm the was also moves. It doesn't take much. Just resolder the entire area, making sure not to bridge a joint and you should be back in business. It might take a while. If there is a silver rf shield plate on the circuit board then it is probably under that.

Good luck.

Perfect????? That's your word.. I said within bounds.

I only see one thing wrong with this. If your running high power... the extra coax length means higer loss. I run just enough coax from the amp to the antenna and have never had any matching problems. This cuts the losses to a minimum.

You seem to be hung up on "dirty" amps. What amount of harmonic attenuation in your opinion, constitutes a "clean" amp. You do realize that ALL amps have some harmonics!

Yeah I do believe that. I have seen a few unstabile amps that will
start doing screwy thing upon being driven with modulation. Otherwise
they behave without signs of trouble.

Not necessarily. If you have a 18 foot length, which reduces
the effects of parallel currents, then putting a choke inline
will shunt this desired length.

I've read the entire thread and am on the floor with laughter. The coax length voodoo lives. Let's see now. The radio is relatively clean because the guy could tune the antenna to a near flat swr. If the radio was putting out harmonics, that would NOT be the case. I understand that the amp is hooked in line at the time, so there is nothing inherent in the structure of the amp which changes the impedance at that point. As soon as power is applied to the amp, the swr goes through the roof, which in a nutshell suggests that the antenna is getting signals at a frequency at which it is not resonant--harmonics. Sure the fellow says that fixing the amp or getting another is not an option. Fixing equipment and getting new is NEVER an option for folks who don't understand what the problem is. This amp is just another example of kitchen table engineering by a guy with a manual, schematic and a soldering gun. Heck, a 10 year old might have put this one together for his dad in the garage--one of 50 they were building in a rush because some dumbass wanted more power on his signal. The owner has a couple options:
1. Use the amp for a boat anchor when he is on the lake.
2. Fix the amp so it is clean on 11 meters and presents no harmonics elsewhere.

He could buy a low pass filter, but a good one will cost him as much as a good repair job if he can find a crook to work on it. Criminals seem to flock together, so perhaps he can get a discount.

Hey Ron, sorry don't have a clue on the Tidalwave, never saw one.. I do have a sweet 16, its a good strong reliable amp. Unless your getting a great deal on the tidalwave, I would pass and buy one from a known manufacturer... Not knowing a thing about it, I would not cut on the box.... Just seems nobody out here has an answer for you.... So, its probably a new or local builder.... good luck on your purchase, Whatever your choice!

Message-ID: <q1QX4.1890$tK3.142860@nnrp1.sbc.net>
Source record: 37358

FS: Galaxy DX 77 10/11 Meter Ham Radio

Small Meter with Scales for Signal Strength and Power Output
Red/Green Transmit LED
Roger Beep (with "ON/OFF" switch)
Noise Blanker/ Automatic Noise Limiter
+10 KHz Switch
PA Features:
Echo Board with Dual Control
Talk info "ON" during Echo
SSB in addition to AM/FM/PA
Three Power Output Levels
10 Watts Maximum Power Output - AM
25 Watts Maximum Power Output - SSB
1.5 KHz Clarifier for Receive Only
5.0 KHz Clarifier for Receive and Transmit

This one is tricked out for those amongst you that desire to use it on 11 meters.

For the rest of us, well I have talked all over the US and Europe using this mobile and barefoot.
It really gets out with a small amp.

$300 plus shipping if sold outside Houston.

Lewis

One asks about an SWR problem concerning an amp and the reply is to use the amp as a boat anchor or have a "criminal" work on it? Why even bother with rhetoric like that? In your extremely humble, narrowminded and ignorant post you seem to imply that it is crooks who work on the amps. What the hell is your problem? Good luck if you ever need tech assistance. After that post many on this ng will probably be loathe to come to your aid should the need ever arise. If everyone who works on amps are criminals, what are you doing here consorting with "criminals"? Go to the hammies forum where you may find a cheerleader or two whose brain operates improperly and short circuits on a regular basis, after all, the capacitive mentally challenged seem to hang together.

Hey Twisted:
How can you complain about my response if you have read the other replies--arguing about the length of coax and such. Fighting about whether harmonics are bad or not. Give me a break. It's pretty apparent that the amp in discussion is a piece of crap. I said he could either fix it or use it as a boat anchor. Is that clear enough for you or do you need further explanation? As it sits in the guys truck, it is totally useless, to himself as well as anyone on the various bands who might have interference from his harmonics. He should NOT expect much from a piece of crap with no quality controls. His original desire was to cure the keying ans swr problem without touching the amp. Well good buddy, that ain't going to happen. the problem IS the amp and nothing more. He can operate barefoot without the amp or get a different amp or fix the one he has, but he isn't going to keep on as it is, and that's what he said in his original post. Read it.

tnom,
If you are wanting an electrical 1/2 wave length feed
line to feed your antenna, your MUST take the velocity
factor into consideration. An E1/2 wave feed line makes
the radio 'see' the antenna's input impedance as the antenna
systems overall impedance, why else would you even want to
use an E1/2 wave length feed line? What has this got to do
with 'parallel currents'? If we assume that an antenna is
properly 'tuned', and that it has a 50 ohm nomiminal input
impedance. Then, we feed it with an electrical 1/2 wave
length feed line, which will reflect that nominal 50 ohms
impedance to the input of the transmitter, there will be NO
'parallel currents' on the feed line, IF by 'parallel currents'
you are implying a standing wave.
Tell me something, do you have any idea of what your talking
about? It sure doesn't 'sound' like it from this end.
'Doc
PS - I can recommend a few good books that would help you.

Courtesy of RF Parts.

SSB amateur radio equipment often used sweep tubes in "SSB" amplifiers. Amplifying "AM" signals can overheat tubes due to their low power dissipation. When using sweep tubes, care should be taken to limit carrier level to about 50 watts output per tube (6LQ6, 6LF6, 6JE6, 6HF5, 6JS6C, etc.). SSB P.E.P. can operate at about 70 watts P.E.P. per tube. Exceeding these power levels will rapidly reduce tube life.

Source record: 37375

I just got a new messsenger 500HD which will only do about 300 watts on a dosey 4002 meter. I drove it with a superstar 3900 gold radio which was set up to dead key 7 watts and swing to about 30 watts. My power supply appeared to be maintaining 13.8 volts at current levels approaching 30 amps. My load was a 1KW paint can type 50 ohm dummy load filled with cooling oil, of course. I'm just wondering what kind of performance other people are getting from this particular model of amp because 300 watts doesn't seem like enough. I thought that the superstar 3900 gold would drive it up pretty close to 500 watts. Would someone please shed some light on this problem.

George

Read and learn.

Not of my authoring. Begin quote:

****
There are two ways in which currents can be caused to flow on the
outside of the coax, "parallel" or "antenna".
"Antenna" currents are induced on the line because of its spacial
relationship to the antenna, and "parallel" currents that result from
the direct connection between the coax outer conductor and (usually)
one side of the antenna.
The "antenna" currents usually will not be troublesome if the
bridge and transmitter are shielded so that RF currents flowing on the
outside of the line cannot find their way to the bridge. This point
can be checked by "cutting in" an additional section of line (1/8 to
1/4 electrical wavelength, preferably) of the same Zo. The SWR
indicated by the bridge should not change except possibly for a
slight decrease because of the additional line loss. If there is a
marked change, better shielding may be required.
"Parallel" type currents caused by the connection to the antenna

will cause a change in SWR with line length, even though the bridge and transmitter are well shielded and the shielding is maintained throughout the system by the use of coaxial fittings. Often, merely moving the transmission line will cause the indicated SWR to change. This is because the outside of the coax tends to become part of the antenna system, being connected to the antennas at the feed point, and so constitutes a load on the line along with the desired load represented by the antenna itself. The SWR on the line then is determined by the composite load of the antenna and the outside of the coax, and since changing the line length (or position), one component of this composite load, the SWR changes too. Remedy?...balun or detune the outside of the line by proper choice of length. Note, it is not a measurement error since what the instrument reads is actual SWR on the line!

>PS - I can recommend a few good books that would help you.

ranger225,
I think what your wanting is some means of 'keying' the
AL-811. If you have an unused PTT contact in a desk mic, you
can use that set of contacts to key the amplifier. Or, If
your familiar enough with your radio, you can install a keying
relay. And the simplest way of keying the amplifier is just
a simple normally open, momentary switch to short the keying
line.

> 'Doc

I have the closed mind?

Have you admitted yet that parallel currents do not use
coax velocity factors? Have you admitted yet that 18
feet of coax has specific properties. It's funny how an
electrical 1/2 wave length of coax has specific properties
that you will readily admit, but a 1/2 wavelength of wire
(coax shield) that doesn't use coax velocities doesn't have
any specific properties. This according to you.

When we quit arguing about velocity factors, let us go back to the original problem and try to make some sense of this. For the moment, we will assume that currents on the shield of coax do indeed have a velocity factor of 1.00.

There are indeed some good reasons for a manufacturer to suggest 18 feet, an electrical half-wave, of coax. It is not a good thing to have a voltage node at the back of the unit because it makes things 'hot'.
It doesn't accomplish much beyond operator comfort, however. What the mfg has in mind is a mild mismatch at 27 MHz, what one might get with a cheezy installation of duals or a bumper-mounted whip or somesuch.

So the conditions at the antenna are repeated at half-wave intervals up the coax. Is that essentially what you are saying, Herr Tnom?

Now Doc, correctly, diagnosed the problem as harmonic output from the amp. So the issue is not what happens to reflected 27 Mhz energy (there isn't much as we know from the flat response without the amp); the issue is what happens to the 55, 82, 110 MHz energy. Let us for argument assume a 9-foot whip on the roof of a Ford Exhibitionist or whatever they call the big one.

Now our whip is an end-fed halfwave at 55 MHz with an input impedance into the kilohms. You can fairly well depend that all of that is coming back. At 82 the whip radiates beautifully doing a dance on anyone with TV channel 5 or 6 tuned in, at 110 it all comes back again.

So if conditions are repeated at half-wave intervals, Tnom has just successfully made the unit hotter than a two-dollar pistol. Eighteen feet is precisely what you do not want because it is a voltage node at even harmonics. Loaded antennas change the argument somewhat but serve to illustrate a basic fact: there ain't no ideal length of coax, certainly none which will accomplish doodley with respect to any underlying technical deficiency in the unit.

In this case, a good lo-pass filter would solve the entire problem and return SWR to where it ought to be. Amp manufacturers find these things inconvenient and apparently "CB Practice"(whatever the hell that might be) hasn't caught up to them. Seems time for an enterprising soul to go into the business.

Gunsmoke,
I heard you and "G" Man talking this afternoon on channel #19 from my hokey base setup. Heard him say that he often reads the NG here and recognized your handle. Unfortunately... I was busy and was not able to respond to your breaks for me. However, I did hear GMan tell you that you were blowing smoke with the new 1pill prototype! I hope he'll make it back to the NG soon and give some long waited info on how good your unit sounds. I will try to make it on tomorrow but don't know for sure yet. I certainly hope to be fully mobile again by Monday. Later...

3622. Re: MESSENGER 500 HIGH DRIVE MOBILE AMP QUESTION

Newsgroup: rec.radio.cb
Date: 2000-05-27 00:00:00 UTC
From: Jay in the Mojave <jay123a@qnet.com>
Message-ID: <39301054.B0E3CD00@qnet.com>
Source record: 37395

Hello George: Yes thetas what I saw, my new Messenger 500 HD did. I returned it for another one, and it did 320, and the original one did 290 on my Bird Model 43.

The dealer told me that the amp I turned in was a good one. I disagree.

What I think it is, poor design and the amps not being tested my the Messenger folks. I sent the amp off with $180 dollars, to another guy, he removed the 4 each 2SC2789 transistors, and installed 8 each SD1446 transistors. Now the amp smokes at 750 on SSB.

I also bought a Texas Star 500 HD, and this amp works fantastic. It takes the 500 watt scale on my Bird 43, and on voice peaks, buried the needle to the right. I bought another Texas Star 500, for back up.

I won't buy another Messenger. They where great a few years ago but not now. Try to exchange it for the Texas Star 500.

Ok...since there was not alot of info to be found on this amp..I looked ALL over the net for it as well.. I am going to pass on it. I am using a Palomar Magnum 4500 at the moment and it does really well for me. I am thinking however of trying out the Texas Star sweet 16 and giving the one I do not like to my Son for his rig. Clean operation is important to me...more so than keydown watts..not knocking ANY brand of amp...but I like to be understood and a little under powered than loud as hell and no one can really make out what I am saying!!

One more thing....I am either going to be using a RCI 2950 EX HP or HR 2510 to push the amp (again I have the 2950..the HR 2510 is on the way. the one I like is going in my moblie the other in my boys) How much drive does it take to key up the Texas sweet 16? Do either of these radio have enough jucie or am I going to have to use a puch amp? I have a Palomar 225 and a Palomar 350 and other OLD amp pushing 80 amps...

Tim I know your answer on this "USE THE 2510 you should not even have to question this!!!!" ;) <--- teasing here

I would highly recommend running your power and ground from the battery!
And don't forget the inline fuses on both leads. You can also install a
noise
suppresser in the positive wire, but keep it close to the battery or close
to the radio, but after the fuse. This will help reduce any unwanted noise,
but nothing will get rid of it entirely. Here is an example:

```
+ ------fuse--noise suppresser----------------------\
BATT
> radio
- ------fuse----------------------------------------/
```

Message-ID: <393055D5.94498168@island.net>
Source record: 37416

Some antennae will not resonate at second and third
harmonics. That means that the impedance is a way off from
50 Ohms which means a high SWR at the harmonics resulting in
a false SWR readings in the CB Band. But the finals still
have to dissipate the reflect second harmonics. Some
antennae that have LC matching devices are like this....
like the cheepos.
So what I am saying that a that in _some_ cases a dirty
signal will not only cause angry neighbors but cause final
damage over time.

No the antenna does not cause harmonics. I am sorry if I was
not clear on that.
Cheers,
John

Or, you can buy a BRAND NEW one for $249.00, if you asked CoaxKid you could get it even cheaper.
http://www.coaxkid.com/galaxy_radios/77.html

There aren't any mods or work you could have possibly done to this radio to make it worth another $51, plus the fact it is USED coming from you.

Gee, you must really be on crackrock. I would never buy a used radio from someone on the crackrock.

You might want to investigate a ganged air trimmer... but remember that those type of trimmers don't have a very large capacitance even with many plates. They are commonly used in tube rigs that could have several kilovolts across them...

3661. FS: Galaxy DX 88 10/11 Meter Ham Radio

Newsgroup: rec.radio.cb
Date: 2000-05-27 00:00:00 UTC
From: Lewis Stephens <km5bh@swbell.net>
Message-ID: <J6%X4.2219$tK3.230066@nnrp1.sbc.net>
Source record: 37434

FS: Galaxy DX 88 10/11 Meter Ham Radio

DX 88HL
Frequency Counter (with "ON/OFF" switch)
Small Meter with Scales for Signal Strength and Power Output
Red/Green Transmit LED
Roger Beep (with "ON/OFF" switch)
Noise Blanker/ Automatic Noise Limiter
+10 KHz Switch
SSB in addition to AM/FM/PA
PA Features:
Echo Board with Dual Control
Talk Back "ON" during Echo
Two Power Output Levels
10 Watts Maximum Power Output - AM
25 Watts Maximum Power Output - SSB
1.5 KHz Clarifier for Receive Only
5.0 KHz Clarifier for Receive and Transmit
TWO YEAR Limited Parts and Labor Warranty

This one is tricked out for those amongst you that desire to use it on 11 meters.

For the rest of us, well I have talked all over the US and Europe using this mobile and barefoot.
It really gets out with a small amp.

$300 plus shipping if sold outside Houston.

Lewis

You might just need to check or change your linear ground or antenna ground and you will be fine. Try bolting the box to the seat were the seat bolts to the body using the shortest ground wire length possible. Good luck

Ken

As far as I know there was no name calling. Sarcasm,
humor, insinuations, and quick wits make for interesting
debates.This is common practice from "Meet The Press"
to "Live with Geraldo". There's nothing wrong with it.

The M-500HD, as it comes from the factory, needs about a 50 watt drive
to get the power out. The turns ratios, some cap and resistor values
are also not optimal. Properly modified and setup you should expect it
to do over 800 watts PEP. Stock, you'll be lucky to see 500.

All I know the amp is made in Florida by storm communications and
their web page has a keydown link but it is just a backyard keydown
with all I could see was storm amps. Hopes this helps They are
supposed to be a Class c amp .

That's quite a step from the Palomar to an 8 transistor amp that requires about a 10w-20 carrier and around 100w pep input, along with 150a of dedicated current.
I'd strongly suggest a 5 transistor amp such as a DaveMade M400 or X-Force X-400, and even these will require 100a. The output will be around 1kw pep.

I would like to know how much money the DaveMade m400 is, and what class amp it is and how it performs on SSB. IT HAS TO BE CLEAN!! I want real TRUE watts, not some harmonic magic BS junk!!! I am not slamming DaveMade or X-force I just aint never seen one in action. (I just got back into CB radios after being out of it over 20 yrs)

As far as DC amps the amp pulls..I am planing on upgrading my electrical system on my 98 Dodge truck anyways. One battery and one alt just for the amp. One for the rest of the truck....any suggetions here??

I guess that the 2950's and so on have a unit-to-unit quality control problem. I've heard some in use that are really beautiful sounding, and have been used for a long time without failuer. Yet I know that most of these units had to be "fixed" from factory mal-alignment before they were really useable.
Others have thrown theirs in the trash, basically, in complete disgust. I have tried to talk to CBer's using some of these models and it was impossible, so much crackly, splattering noise and drift... and some of these folks seem to think putting a kicker inline with it will somehow clear up the problems they seem to be having with everyone telling them they can't hear them! :-)
Anyway... there seems to be a wide disparity in models.
Maybe I'm wrong, I've never actually owned or used one. Enlighten me please!
Linus

Linus, I'm not an expert, but the 2950 I owned had SEVERE drift problems...
(off frequency all the time and had to adjust..)
That's why I gave it away to one of my many girlfriends, and the reward I got
in return for giving it to her was worth more than the 2950...

With low drive amps (4 watt input) do you need to turn down the SSB on the radio for 4 watts pep?
If so, is this possible to do with a 2510 or 2950?
Thanks

One of the better posts I've seen regarding the 'magic' of feedline
legnth.... it was here several months ago. Quoting.....

There are only two cases where feedline length will make a difference
in VSWR readings. Both represent undesirable conditions in your antenna
feed system. Case one is when the coax is significantly lossy. Then a longer
coax will have greater loss and VSWR will appear to be lower due to
attenuation
of the reverse voltage wave. This is an obviously undesirable situation
since
power wasted heating the coax isn't being usefully radiated. To avoid this
situation, use the lowest loss coax feasible, and cut it to the shortest
length
practical in order to reach from the radio to the antenna. If you still have
a
VSWR problem, solve it correctly by adjusting the antenna to present a
50 ohm load (this may require a matching network).

Case two is when the coax is serving as *part of the antenna* by
supporting common mode currents. In this case, changing coax
length is actually changing antenna length, which will of course
affect VSWR. Problem is, the coax is inside the vehicle where the
radiation it produces due to common mode currents is doing you
no good, and can cause harm by interfering with vehicle electronics
or causing "hot chassis" and RF feedback problems with your radio.
Solution. Ground the antenna base well to the car frame and body,
and use a common mode choke on the coax if necessary, in order
to suppress radiation by the coax.

There is only one situation where varying coax length can serve
as a matching device between the radio and the antenna. That's
when the coax is being used as an impedance transformer. You
can't do this if you're trying to match a 50 ohm transmitter using
50 ohm coax (you just run round and round the constant VSWR
circle on the Smith Chart). But you can do it if you are using a
coax of *some other impedance* chosen so that in conjunction
with the length you get the proper impedance transformation.

Example, specific lengths of 75 ohm coax are often used in 50 ohm
systems as an impedance transformer. One common case is to
combine two antennas into an array. A quarterwave of 75 ohm cable
will transform the 50 ohm feed impedance of an antenna to 100 ohms
at the other end of the cable. If you do that for each antenna, you can
then join the cables with a coax Tee to get 50 ohms to present to the
radio. (The Tee combines the two impedances in parallel.)

I have been one jumping on tnom in this thread but, in the interest of getting the facts out, I have to stand with him here. The velocity factor of common mode currents which travel down the outside of a coax is close to 1.0. The coax velocity factor generally refers to the speed of the electromagnetic waves within the coax. This number is always lower and often between 0.6 and 0.9.

While I personally don't believe that there is any good reason to cut a coax to 1/2 wavelength, if you did want your coax at a 1/2 wavelength for common mode currents, it would be roughly 18 feet long.

Jason, describe how you've mounted the antenna. With a 3:1 VSWR I agree,
it sounds like a bad ground.

IMO, it is a waste of time to fuse the negative lead on a CB radio.
There is no benefit to doing this and there is no danger if you do not.
This (t)urban legend has come from the LMR and amateur folks who run
radios that are specifically designed for negative ground only. Most all
CBs that I'm aware of are floating ground.

I agree totally.

I tried to get the FireStik (sp?) guys to explain to me how they
could recommend 18' lengths for their mobile antenna coaxes.
All I got back was a cheap, personal attack.

> Here is one point to show that the above is a bunch of garbage. Where
> the voltage/current nodes appear depend on the electrical length of

> the transmission line - NOT the physical length. If the above were
> true, then they would have to specify the exact type of coax to use.

I don't think you picked the best example to demonstrate what is
wrong with those claims. The folks who believe that 18' is a
good length believe this because they think it is a tuning
stup to block common mode currents. The common mode currents flow
down the outside of the coax where the velocity factor actually is
close to 1.0.

While the theory has some merit, my opinion is that, in reality, it
has no benefit. However, I do agree that 18' would be about 1/2
wavelength to common mode currents.

I believe their claim is flawed because it basically assumes that
the impedance to the common mode currents at 18' is infinity.
With a radio (possibly even attached to the chassis) and microphone
and power cord, the impedance at this piont is anything but
infinity. Thus, at 1/2 wavelength away (at the antenna feed), the
impedance to common mode currents is anything but the desired
value of infinity.

> The outside of the coax is not supposed to be part of the counterpoise.
> If it is, then there is a problem somewhere - and that problem may be
> in a lousy antenna design.

I wouldn't blame it on the antenna. For a mobile installation, and
especially in cars with fiberglass bodies, the problem is usually
the lack of a good counterpoise. You can't blame the manufacturer
when your Wilson 1000 doesn't work well on your Corvette. It's a
tried and true antenna; the problem lies with the car body which
is beyond your control.

3694. Re: 102" Whip Antenna

Newsgroup: rec.radio.cb

Remove the coax connector at the radio and check for a short from the center to the shield. More than a few times the mount has been installed wrong causing a short. It is fairly common to leave out insulators. Not worried so much about the cable having a short(could be) as that the antenna is shorted to ground through the mount.

3695. Class C defined -- was heard it all

once
> and for all!

If you have built a decent unit, good for you. There is certainly enough trash on the market already.

It looks as if 'Class C' has been defined in the 27 MHz region as anything that draws on less than 180 degrees of the rf cycle. OK, it's your band, feel free.

In the real world -- the broadcast transmitters I got to work on for example, Class C is a bit more than that.

a). the grid-base-gate current drawn by the device is used to supply the major part of the bias by way of a resistor to ground, unbypassed. This is usually called a grid-base-gate leak resistor. In lo-impedance circuitry like bi-polar transistors it can take the form of an RFC. So unlike A or B, the bias fluctuates with the input signal and tends to turn it into a more-or-less square wave at the plate-collector-drain.

b). Because the waveform is purposely distorted, there is no way any form of amplitude modulation survives and harmonics are produced by the bucketload. A very selective tunable tank system is an absolute requirement. FM transmitters typically used very high Q strip lines for that reason in their output tanks.

c). The squaring up of the output signal is the reason both for the give-or-take 120 degree draw and the very high efficiency of this class of operation. It is a primitive switching system, not an amp class.

No big deal unless you try to confuse the two. I think you have done just that a few times; me and a host of others have used the real-world definition of Class C (RWC?) when you were arguing from a CBC position which us flatlanders call Cheezy Class B. It produced a lot of heat and not a lot of light. You might want to keep the CBC definition on 11 meters to keep the laughter to a gentle, ladylike belch out in the real world.

One place where your design does follow the real world is that it is single-ended. Virtually all broadcast transmitters I have dealt with are single-ended because of the simplicity of the resulting design and the prevention of cascading parts failures. Five kilowatt FM used a single 4CX5000 and a ten kw used the 4CX10000 (tetrode, ceramic, with a 10,000

watt plate dissipation rating -- it would survive a dead short). Before someone points out that a number of FM stations are rated at 100kw, this is effective power which includes antenna gain. In general, even in later designs, they stay as close to single-ended as possible. By using a single device you have made matching a lot simpler and results more predictable. Things with transistors in multiples of eight tend to give anyone with any experience a bad case of hives. Good move.

Might I suggest that a decent lo-pass filter would be a worthy addition. You will generate some harmonics as a result of the distortion inherent (if perhaps nearly inaudible) in the use of the CBC theory -- there are better places to get rid of them than the collector of your transistor in the form of heat when they come back down the transmission line. It also makes comparison of amps a bit fairer when trash-generators don't get to count spurious radiations as output power.

In the long run of things, the single-ended design is more of a breakthru than Class C however it is defined.

The guy never said where his SWR meter was located, if it is between the radio and amp his readings may be completely normal. As far as common mode current this is probably a grounding/bonding problem. High SWR DOES NOT cause common mode currents although the conditions that do cause them will also cause a high SWR.

>
>
>
>

The good splitters have a 100 load across the output ports that absorb out of phase/ balance power to keep the finals from heating up. If everything is in balance the voltages across the resistor is equal so it disipate no power. I actually know a guy who combined two amps together just to split them again with a cophasing harness to drive two antennas. Never have been able to convince him all he needs is the splitter between the amp and radio.LOL

3698. FAQ?

Hi George
Ok I can see you your point.

So then, do you think that is why mobile
antenna manufactures always use 18 feet
of coax? This has always boggled my
mind... why 18 feet!
Cheers,
John

you previously posted it held 100w rms, which is the true figure 100w or 140w ?
I also believe the question he wanted to know is how many peak watts, not peak rms watts.

You're right... neither is a real breakthrough. The real breakthrough with my amp is the efficiency! Every other bootleg amp out there that I have seen has between 30-55%. Most are around 40%. This is awful and not acceptable in my opinion. It has the following problems:
Puts too much heat in the sink - pure waste.
Requires elaborate heavy wiring.
Requires cooling fans for relatively low power outputs.
Requires very low voltage drop connections due to excessive currents.
Puts undue stress on the transistors involved causing reliability problems.

This is almost entirely due to poor impedance matching! It is nearly impossible to get a good match in the high power bipolar world with transformers. The bipolars are just too low in impedance(1-3 Ohms typically for high power devices). They require a high transformation ratio and transformers in the 16-49 transformation ratios are extremely hard... if not impossible to make work right! They have too much leakage at those high turns ratios. That's why they all work poorly... Now for power FETs that have perhaps output impedances of perhaps 10-15 Ohms(at 28V)... they work very well at a ratio of 4:1

In this world of transistor amps... matching ain't everything... but almost!!!

Richard,
---- msg.clipped ----
> For the moment, we will assume
> that currents on the shield of coax do indeed have a velocity factor of
> 1.00.
>
Sorry, a velocity factor of 1.0 is impossible when speaking
of currents flowing in any portion of a coaxial cable. A 'VF' of
1.0 is only possible in 'free space'.

> There are indeed some good reasons for a manufacturer to suggest 18 feet, an
> electrical half-wave, of coax. It is not a good thing to have a voltage
> node at the back of the unit because it makes things 'hot'.

Not a voltage 'node', it's a voltage 'loop'.

> It doesn't accomplish much beyond operator comfort, however. What the mfg

> the business.

The problem with the manufaturors is that they are 'cheap', and
design and components for a 'tank' circuit cost money. As long as
they can get away with it, they are not going to spend any more than
they have to.

3718. Re: SWR question

Newsgroup: rec.radio.cb
Date: 2000-05-28 00:00:00 UTC
From: w5lz <w5lz@oio.net>
Message-ID: <39311081.F936DCD@oio.net>
Source record: 37491

George,

ex: 1
492 x .66 = 324.7

324.7 / 27.2 = 11.9 feet
---
ex: 2
492 x .98 = 482.1

482.1 / 27.2 = 17.7 feet

Using ex: 1, which is the electrical 1/2 wave length of
RG-58, RG-8, RG-59, RG-11, and RG-213, then by your statement,
11.9 feet is roughly 18 feet. 33% accuracy? (Wish you worked
at my bank!)

Using ex: 2, which is the electrical 1/2 wave length of
'ladder line', or open wire feed lines, then by your statement,
17.7 feet is roughly 18 feet. I agree. But how many people
do you know who uses a ladder-line feed line on the CB band?

As a 'rough' general rule, using the most common kinds of
coaxial cables, your 18 feet of coaxial feed line bears no
relation to an electrical 1/2 wave length. So, why would you
want to use 18 feet?
Now if your talking about an isotropic antenna (you know,
those imaginary antennas.) at 27.2 Mhz, an electrical 1/2 wave
length is the same as a 1/2 wave length, and 18 feet would be
'roughly' correct. You don't worry about velocity factors when
dealing with 'perfect', or imaginary transmission lines to feed
your 'perfect' or imaginary antenna. This is all well and good,
but when you come back to the 'real world', where things are not
'perfect', you have to deal with velocity factors. I've never
spoken to anyone on an isotropic antenna...

He did indicate that the SWR meter was reading SWR both with
and without the amplifier in-line, and that indicates that the
SWR meter is in-line between the amplifier and the antenna, where
it should be.

DaveMade 16 Pill, Excellent Condition, Plenty Swing or Dead Key depending on how you like it, Several Upgrades to an already great amp.

Input Tuner (enables you to fine tune the 16 pill to any driver)

Upgraded out-put capacitors (lets you more safely volt this box if you want)

Upgraded Grounding Circuit (maximum output with extensive grounding system)

With Quick Disconnects (both ends)

Box has very little usage and is in top notch condition.

$800 plus shipping and insurance about $20 or less.

Reply to rayjr@earthlink.net or 301-625-1552

I would be very careful before buying this radio from this guy. Search through this newsgroup and you will see he had a DX77 for sale for the same price, and started getting flamed for the high price.

By the way, you can get a brand new DX88 for $329, so who would want a used one?

Patrick

Sorry, slightly off topic, but I know someone out there tell me
if it is possible to buy a transformer that will step up 120
volts USA too 240 volts UK, and the name of a supplier. I have a
piece of equipment I wish to send someone in the States that
requires a 240 volt supply with very low power consumtion (about
40 watts absolute max).

Many Thanx
Mickey

Source record: 37502

With low drive amps (4 watt input) do you need to turn down the SSB on
the radio for 4 watts pep?
If so, is this possible to do with a 2510 or 2950?
Thanks
---

thats ok , but how ever you do need an amp built for side band ,you need a
different slower relay for sideband , with no carrier the am relay chops
your audio as soon as it drops off , and it usually ends up[missinf some of
your words . also some poorer quality amps sound so bad on ssb its not even
worth using .

The Amp that I have does have SSB/Am/Fm...
Its a 10-80 meter amp 100watts out...
Its 4 watt input, so its definately low drive...
So I dont know how high I can go on SSB input..
Is it typical for amps to cut the power down themselves for the input drive on SSB, or do you need to turn the SSB down to swing below 4 watts (is it even possible)

If anyone knows im stumped..

youll be fine putting the power of the radio on ssb into it. you can drive it harder on sideband because its less duty cycle. just turn the power down till your getting max power out of the amp still. should be around 15 watts

Source record: 37521

I did read ALL the posts. I could care less what advice you give.
Nowhere did I attack your technical advice that was given. My problem
was not your info on harmonics, coax length or the such. It was the
reference to a "good repair job" if he can find a criminal to work on
it and THAT statement alone, that I took reference with. This makes it
sound as if all folks who work on amps are criminals. Are you not
inferring this? You fail to even address that in your reply and that is
the ONLY item I took issue with. Don't put words in my mouth.
And Doc, I am clueless as to who wiped a boogie on you. IMO, your posts
are usually to the point and you state your position without predjudice.
Maybe you are just having a bad day, or did I hit a nerve with my last
statement?

From: Jason Boswell <mbos@nospamiastate.edu>
Message-ID: <sj2jda535pj52@corp.supernews.com>
Source record: 37532

Yeah they do have an FAQ for this group.....not very helpful if ya ask me. It is very basic and really just explains what cb radio is and explains that anyone can use it. I would like it if I could get ahold of an intermediate version of this FAQ so I would not have to ask stupid questions as well but I don't think there is one. All I can say is go to www.dejanews.com (thinks that's right) and do some searches through the news group for what you want to know and search all the archive almost any question is in there and if not.....HEY.....post it up you probably have a good question.

Boswell.....

I'm new to the world of CB radio, and have been looking at mobile antennas at local stores and flea markets. I have seen quite a few Pyramid brand antennas, and I can't seem to find any information about them anywhere. Does anyone know if this company has an internet site? Can anyone tell me about these antennas?

Any information anyone can provide will be appreciated.

Message-ID: <8grpj2$n4b$1@slb7.atl.mindspring.net>
Source record: 37542

While this is very true, The reason I mention it is that if you are running your power straight from the battery, and for example you need to get a jump start and some fool hooks up the cables wrong, it can send a power surge through the negative power lead at the terminal. Granted this is a very unlikely situation, but you never know. I look at it like this, yes it is overkill, but what is a $2.00/max fuse compared to a $150.00 - ???? cost in replacement of the radio and associated equipment. Even though the cars ground should take that surge away, but what if it doesn't? Like I said it is a bit of overkill that may never play any part what so ever, so it is up to the person doing the install.

Antron 99 "box and manual" for sale, will compliment any Antron
99 antenna.

Only $49.99 + Shipping. No time wasters please.

Cheers Mickey

This time the Whole Quote.....

There are only two cases where feedline length will make a difference
in VSWR readings. Both represent undesirable conditions in your antenna
feed system. Case one is when the coax is significantly lossy. Then a longer
coax will have greater loss and VSWR will appear to be lower due to
attenuation
of the reverse voltage wave. This is an obviously undesirable situation
since
power wasted heating the coax isn't being usefully radiated. To avoid this
situation, use the lowest loss coax feasible, and cut it to the shortest
length
practical in order to reach from the radio to the antenna. If you still have
a
VSWR problem, solve it correctly by adjusting the antenna to present a
50 ohm load (this may require a matching network).

Case two is when the coax is serving as *part of the antenna* by
supporting common mode currents. In this case, changing coax
length is actually changing antenna length, which will of course
affect VSWR. Problem is, the coax is inside the vehicle where the
radiation it produces due to common mode currents is doing you
no good, and can cause harm by interfering with vehicle electronics
or causing "hot chassis" and RF feedback problems with your radio.
Solution. Ground the antenna base well to the car frame and body,
and use a common mode choke on the coax if necessary, in order
to suppress radiation by the coax.

There is only one situation where varying coax length can serve
as a matching device between the radio and the antenna. That's
when the coax is being used as an impedance transformer. You
can't do this if you're trying to match a 50 ohm transmitter using
50 ohm coax (you just run round and round the constant VSWR
circle on the Smith Chart). But you can do it if you are using a
coax of *some other impedance* chosen so that in conjunction

with the length you get the proper impedance transformation.

Example, specific lengths of 75 ohm coax are often used in 50 ohm systems as an impedance transformer. One common case is to combine two antennas into an array. A quarterwave of 75 ohm cable will transform the 50 ohm feed impedance of an antenna to 100 ohms at the other end of the cable. If you do that for each antenna, you can then join the cables with a coax Tee to get 50 ohms to present to the radio. (The Tee combines the two impedances in parallel.)

>Solution. Ground the antenna base well to the car frame and body,
>and use a common mode choke on the coax if necessary, in order
>to suppress radiation by the coax.

And the above case to one degree or another can occur in a less '
than optimum mobile installation. Most mobile antennas are less than
optimum.

>There is only one situation where varying coax length can serve
>as a matching device between the radio and the antenna. That's
>when the coax is being used as an impedance transformer. You

>coax of *some other impedance* chosen so that in conjunction
>with the length you get the proper impedance transformation.

And the above case does marginally happen also. The mobile antenna
is usually at resonance less than 50 ohms. Because of this some of the
quarter wave matching properties can be used to your benefit.

snip

I would have to say that the worst C.B., by far, that I have owned was, (way past tense), the Montgomery Ward's weak version of a C.B. radio called a Royce !! What a piece of "Kuka"!! Low output audio and very weak recieve. Approx. 75% of the Royce radios sold had to go for warrantee work. Glad those days are behind me. Second to the Royce was a Handick. Those were the good ole days. NOT.....Remember, it's not what you've got but how you use it..... unless, of course, you own a Royce.
LOL....."Porky"

It is illegal to manufacture them, use them, and presumably aid in the process by repairing them. A person who knowingly commits a crime is a criminal. What's your problem with someone pointing out the truth? There are all sorts and degrees of crime, and I would equate it to murder or rape, but crime is crime in the generic sense.

Didn't think that I inferred anything. Just a hard statement of the facts.

In the mean time, the guy with the amp needs to either clean it up to make it useful or dump it. Better it should be anchoring his fishing boat than occupying space in the land fill!!

I don't know if that amp was class C. It sounded good on SSB. The 100
had two MRF455's.

And now you know why experienced techs get hives when transistors work in
8-packs! Multiple devices also get into issues of device balance: no two
work the same way. Anyone who has built or seen a hi-voltage or hi-current
supply with multiple diodes knows about balancing resistors, transient caps
and the whole cortege of gizwidgets to keep the whole structure from a
cascading collapse under stress. If diodes are a minor nitemare at DC,
envision eight transistors in push-pull parallel! Two matched tubes in
parallel was not a great idea when Yayhoo did it; the four or more sweep
tubes in parallel of some amps built by the boys in the bodyshop was simply
disgusting.

You may want to investigate the wonders of pi-sections or their variants.
Lo-pass filters are simply 50-ohm pi-sections tuned to about 30 Mhz so they
pass only below 30. But you can do some impedence transformation in them as
well (note the output tank of your 4 watter -- it is about a 20:1 pi). Off

the top of the head, it seems that you might use a convenient transformer to start the job, a pi-section or two to finish it, and get about 30db harmonic supression in the bargain.

Now you also know why I was a great fan of FETs or FET modules. Made the plumbing a lot less complex.

Dick

By the way, soon all american auto companies will be dropping the
12volt system and going to the 28volt system.

Hint: It's time to get the Telstar engineers off their butts and back
to the drawing board. The first inexpensive mass produced 28volt
CB targeted FET amps could make the producer, as the Professor
says, "a million bucks".

Just bought a new car and want to know what is the best trunk mount antenna out there, Wilson 1000, K40, Hustler HQ27, Solarcon, Firestik or another brand? Also, are the trunk mounts by Comet and Diamond good to use with CB antennas? Thanks.

All the vertical transformer amps (Boomer, Palomar Elite,
Palomar Deluxe, Boomer Deluxe, etc.).

The original designs use very high gain transistors and
no negative feedback. The result is an extremely unstable
product.

Source record: 37589

On May 28th A&E had a special on the 10 most popular "fads" of the previous century. At number 7 was CB radio.

Included were some clips of CB movies of the time and some sneak pics of "classic" radios.

What was funny was that most of the pics of "current" rigs were "exports"! Mostly featured were Northstar's and a DX99! (But the freq displayed was 27.185)

In the narrative, they said that CB as a fad died out in 1979, but then went on to say that over 2 million CB's are still sold annually. Doesn't sound dead to me!

Unfortunately, the piece made it sound as though the non-trucking users were interfereing with trucking as if CB was the sole domain of the 18 wheel crowd.

If you can catch it, it was pretty good.

Steve

The current loads for things like power seats, rear-window defoggers, blower motors, heated mirrors have gotten so stupid, going to 28 might not be that dumb. Why stop there, go to 32 and you can charge the battery with an old Wincharger. ' Leap into the past' makes a better motto than 'Strive for mediocrity'. :=)

It might be less expensive to look for a 220v to 120v xformer with a rated output (120 side) of 16 amps... means the 220 side will be designed for about 8 amps (what he's looking for) Just wire up the 120v side to 120v cord and the secondary will provide 220 at 8amps... Transformers work both ways, up & down, only the current rating of the windings differs. I've done this dozens of times with 480v-120v xformers when I needed a 480v low-current output for testing.

Source record: 37599

Hi
I have a Yaesu FT-757 GX,and the power out put is low on 20,40,and 80 meters.But it is really good on 10, 12, and 15 meters,130 watts .The rig had been used on the "free band" before I got it,and was tuned for that area of frequency.I have tuned the RF unit according to the service manual,but the power is still concentrated on the higher frequencies.Is there something else that is done to these radios for use on 11 meters as far as peak tuning?If so,how can I get the power back up on the other bands?I posted on amateur equipment news group,but got no replys.Though I'm not a free bander,because I get caught at everthing I do,I had been involved in cb for a while,and know there are many good operators on 11 meters, and helpful ones.So I thought I would ask here.

Thanks much
Rob

3834. Re: Anyone here know how to tune a FT-757?

Newsgroup: rec.radio.cb
Date: 2000-05-29 00:00:00 UTC
From: Gary Danaher <gdanaher@home.com>
Message-ID: <39327849.338A07A2@home.com>
Source record: 37607

I'd start by finding a service manual on the radio or someone who can actually align it to factory specs. Sounds like someone tweaked it to get 130 watts out, and that might be the first step. Untweak it back to 100-105. I have a friend who used to own one, and I believe that each band was independent of any other, but there are a lot of things in that box that someone might have messed with. You might have to spend some money on it to make it work correctly.

3842. DX Station Numbers - Where do you get them ?

Newsgroup: rec.radio.cb
Date: 2000-05-29 00:00:00 UTC
From: Richard Smith <rsmith@planeteer.com>
Message-ID: <m5wY4.3150$qS3.8725@tor-nn1.netcom.ca>
Source record: 37615

On LSB/USB, I quite often hear people using station numbers e.g. "1234 Kentucky" etc. Where do you get one of these numbers and who assigns them ? I am up in Ontario, Canada if anybody can help.

Thanks,

Richard.

3843. SSB CB Base Station Suggestions ?

Newsgroup: rec.radio.cb
Date: 2000-05-29 00:00:00 UTC
From: Richard Smith <rsmith@planeteer.com>
Message-ID: <n5wY4.3151$qS3.8725@tor-nn1.netcom.ca>
Source record: 37616

Can anybody suggest a good base station CB with SSB ? I see that the Uniden Washington is very popular, but I believe that this model has been around for quite a while. Are any of the newer models any better (e.g. Ranger 696) ?

Would a mobile SSB CB with a 12V power supply work just as well ?

Any suggestions would be appreciated.

Thanks,

Richard.

3844. Discreet Base Station/Loft Antenna Suggestions ??

Newsgroup: rec.radio.cb
Date: 2000-05-29 00:00:00 UTC
From: Richard Smith <rsmith@planeteer.com>
Message-ID: <o5wY4.3152$qS3.8725@tor-nn1.netcom.ca>
Source record: 37617

Can anybody suggest a good antenna that could be mounted in a loft ? Is the Firestik base station antenna any good for this ? Or would it be better to buy a good mobile antenna (maybe a Wilson or a long whip) and mount it on a groundplane in the loft of my house? The roof is wooden framed and so attenuation may not be too bad.

Are there any discreet base station antennas out there ? If I were to mount a base antenna flush to the wall of my house, would performance be drastically reduced ? The top half of my house has aluminum siding, so would it act as a "reflector" or just produce a horrible SWR ? The bottom half is brick.

Maybe a balcony antenna would work better mounted high up under the eaves of the house ?

I would really like to get into SSB DX'ing, but I am somewhat limited with the antenna I can use.

Richard.

Your first statement stands alone and is open to interpretation, but nevertheless it is dead wrong. It is NOT illegal to manufacture, own, build, or repair an amp. If you want to split hairs and cite rules and regulations pertaining to USE, then you may have a valid point. But to stereotype ALL folks who work on amps as criminals is a bit much. By the esteem of your token logic, (a crime is a crime...) we can classify you as a criminal if you:
a) operate a cb other than stock
a) exceed the speed limit
b) tear the tag off your mattress
c) let your pet's license and vaccinations expire
d) and on and on.....
To label said offenders as "criminal" is absurd.
I not once questioned the merit of your technical advice concerning the amp itself. Just your take on folks who work on them.

Klyben,
Makes you wonder, doesn't it? Multiple alternaters,
big batteries, and if they are very lucky still only about
50% efficiency over all. Extended use of something in the
10kw range is self limiting (v/cm) you know. Hope they
have fun.

Source record: 37633

Richard,
Any antenna mounted inside a house, or right next to a
house is going to be partially 'crippled', just won't hear
what you need to hear. With the metal siding, you sure
don't want to mount an antenna next to the house.
Using a dipole might be an alternative. They aren't all
that hard to hide, but do have 'draw-backs'. Mounting an
antenna on a balcony might also be a reasonable alternative.
Same as with any antenna, you want it as far as possible from
any surrounding objects, like your house. But, you should
be able to make it work.
Good luck...
'Doc

Solar Panels, Wind powered generators (for highway use only) and small rodents running in wheels. (only kidding)

I too am curious. Maybe they have several car batteries and an extra alternator running ? After all, the high power is only required while talking and not nearly as much when listening, so the duty cycle would be quite low (unless you are a real chatter).

Also (more knowledgeable people should correct me here) the output power is not maxed continuously while talking, as the output waveform does not peak on every crest or trough (unless I believe you are running FM perhaps).

Richard.

3866. Mounting radio in a Dodge Truck

Newsgroup: rec.radio.cb
Date: 2000-05-29 00:00:00 UTC
From: pushrod02b@aol.com
Message-ID: <20000529133952.17022.00000727@ng-fq1.aol.com>
Source record: 37639

I'm sorry I never replied to your post, Richard. I received an email from someone else about it and just realized today that it wasn't you. Anyway, here's what I did....
There is one drawback to this, nobody will be able to sit in the middle of your bench seat.
Under the middle seat are two bolts which hold the seat to the floor bracket (one on each side). Make two L-shaped brackets...drill holes for bolt under the seat and holes to line up with the side of your radio. Bolt each bracket under that middle seat using those existing bolts. Now you have two brackets sticking out from under the seat and running up in front of the seat...no holes in truck. Mount the radio with the bottom against the front seat, (the face of the radio should be about an inch above the level of the seat) to the brackets you made. This is very handy for the driver to reach all knobs and it still doesn't get in the way of shifting if you own a standard shift. If you email me I'll send some pic's of mine to better show what I'm talking about. It's rough looking but you can make your brackets as pretty as you want. Ray, if you are reading this too, I haven't forgotten about you. I'm still going to send you the pic's as soon as I take them....

It is probably already set up for 11m because sweep tubes don't work worth a damn on 6m. Of course they are not so great on 11 either. The thing is already overpriced for an as-is amp. Tubes will cost another $50.

I had one of those three foot base antennas and it worked really crappy so stay away from those. I got pretty decent results with the firestick indoor but that took some doing and modifying. What I am using now is a random length wire tuned with an antenna tuner and I talk anywhere from 10 to 20 miles barefoot when there is no skip, usually. If random length wire is the way you want to go, MFJ sells a small $50 box that matches wire to the transciever. I do not have one of these but with the results I am having with my tuner, I would think it would work quite well. Hope this helps!

PB.

Just look at all this controversy I find... Forgive the confusion- it has the factory 11 meters. In addition (the one guy got it right), my Yaesu tech friend (the other one was also right) installed the two extra 11-meter crystals in the 10-C/D slots. The amp and the display are sold. At this time, I'd let the 101-E and the ext. VFO go for $300.00 firm + shipping from 91406. If anybody's interested, respond email to: toomuchstuff@pobox.com. Radio comes with 1 set new driver and finals (NEC) and several sets of good, used tubes, factory owner's manual and factory service/mods manual.

3887. Amps

Newsgroup: rec.radio.cb
Date: 2000-05-29 00:00:00 UTC
From: Jerry Oxendine <joxendi@bellsouth.net>
Message-ID: <3932E03F.56BF@bellsouth.net>
Source record: 37660

Hey Guys,
There is a lot of debate about the legality of owning, operating, manufacturing, or repairing linear amps in CB radio. If the following set of rules are current (I got them off CB Radio Resources), it would appear that it IS illegal to own or have in one's possession a linear amp unless you have some other license which permits it. I didn't read anything about REPAIRING them, tho. While it is not in these rules, I believe there is another rule about manufacturing or importing amps that are capable of operating on 11 meters--they can't even build them with 10 meters ready to go, but they can provide a licensed ham with the necessary information to convert his newly purchased amp to work on 10. Am I correct on this? There is a rule, I believe, that prohibits a ham from building more than two amps in a 12 month period, but I betcha that would be hard to prove if he did! If I read this thing right, if the Fox Candy Company comes in to inspect a CB station and they find an amp on the premises, they COULD fine the owner unless he were licensed in some other service. I seem to remember a ham with a repair shop who was "visited" by FCC agents and he had several old CB amps lying around. The way he got around that was that he told the guys that he was robbing parts out of them for other ham projects. So the whole thing could still be ambiguous and open to interpretation. I didn't post this to start a flame war, and if I made anybody mad, that wasn't my intent. I just wanted to comment and get some other interpretations on these rules. What do you think, and how do you fellows interpret the following rules. I don't even know if they are up to date.

73

Richard,

On this end, I use an RCI-2950, with a power supply, and an Antron 99 for my antenna. Even without a power mic, I have talked to over 700 stations in the past month. That is great, considering conditions haven't been all that super. The RCI will do you a fine job, and will put out about 40-45 watts when peaked out.

Is it possible for the guy to install a 240 volt receptacle? This is a
common voltage in the US, every business or residence has this voltage at
the electrical panel. If not I have some big transformers that will do what
you are talking about but they are real heavy, about 50 pounds.

There is also a rule that says you cant put out more than 4 watts on a 11
meters I guess with the fcc limited resources the can't check every car or
home that has a CB I think the only people that get caught are the mega watt
home bases then it take a lot of complaints form home owner to get action.
Just my thought on this.

Out of nothing but curiousity are you sure about the 28 volts?? There was a kind of unwritten agreement over the years where cars used 6 and 12 and industrial thingees used 8 and 16 to keep battery theft down to a gentle roar. There was some 24V military and 32 has been standard forever for more heavy-duty use going back to WinChargers and older railroad passenger cars. A lot of planes used 28 volts again to keep their batteries from ending up in Midnite Auto Supply. A nominally 24 Volt system will run pretty close to 28 anyway so maybe that's what they are getting at.

This i know for sure

(A) You may own a linear amplifier if:

(1) You do not own or operate a CB

(B) You may repair or build a linear amp if:

(1) You do not own or operate a CB

If you truly are presumed innocent until proven guilty Ha Ha, then the first thing that must come into play when enforcing any FCC rules is ownership of a CB or a transmission of some sort. Lacking these, anything goes.

I hate to ask, but are you measuring the output into a dummy load or a CB antenna? How "low" is the output on the lower bands? Check LPF/BPF(s) for the lower freqs.
Steve.

No I am not sure. The publication was a few months ago. It could be
32. at the time I remember the voltage being perfect for FET use. It
is in this voltage area.

Only if you put an artificial car under it. The K-40 is half the antenna.
The car is the other half. If you attach four 108" ground wires (radials)
to it and stretch them out, it could work acceptably.

I have an 87 jeep wrangler with a C.B. installed and every time I key up the radio dead keys at 7 watts and at idle the engine sputters and if I turn on the linear 175 watts the motor dies. I have replaced everything I can think of . The jeep recently went D.O.A. and I replaced the coil, the coil sensor and the ECU. The computer ended up being bad. Now am I at risk of burning out the computer again? or is it just interfering with its function? Is there a fix for this?

Run a legal power (4 watts) CB and you should be fine. I can't believe people run 175 watts on their CB. Get a ham license if you want to run that kind of power legally. And OF COURSE it's going to cause problems... I'm sure it's splattering harmonics and you name it over a huge width of the band.

Bought a used 1991 Chevy Corsica (3.1 litre V6, automatic) and transfered my Eagle Sidewinder 400 and K40 from the Cavalier to it today. To my surprise the antenna is picking up alot of noise from the fuel pump. I unhooked the antenna just to make sure it wasn't coming from the power leads which go right to the battery. I tried mounting the K40 to the trunk lip and ran a ground strap to the frame, still had noise. Put the magnet on the K40 and mounted it in the center of the roof, the noise was still there but at a lower level. Took the magnet off and tried the left corner of the hood, NOISY. Does anyone out there have any idea how to stop the noise? This is my 3rd Chevy and never had any noise trouble before now. Thanks.

GT,
A hand-held is no different than any other radio. If
a particular amplifier will work on a 'mobile' or 'base'
radio, it should work on the hand-held. I can think of
two "buts", power output of the hand-held has to be able
to drive the amplifier, and the hand-held would need a
connection for an external antenna. Other than those
qualifications... why not?
'Doc

3916. Re: Noisy Corsica fuel pump HELP

Newsgroup: rec.radio.cb

From: w5lz <w5lz@oio.net>
Message-ID: <393321F0.2DA65673@oio.net>
Source record: 37689

Chris,
First, I'd check with a GM dealer for the 'kit' that
they have for noisy fuel pumps. If that seems too much,
try a .47uF/30 volt ceraminc disk capacitor across the
fuel pump power line to ground.
'Doc
PS - naturally, you should put the capacitor in the
hardest plcae to reach, at the pump.

Stephen,
Several things to try;
1. Run power leads to the battery, not the ignition switch.
2. Ground or shield the computer. (No idea where it's at,
so use your own judgement about grounding/shielding)
3. Ground radio to chasis.
4. Mount antenna so it is grounded.
5. Run all cables as far from the computer, and ignition
wiring as possible.

If none of that works, I've got this '51 Ford pickup
that is not affeected by RF....

Source record: 37693

Darrin,
Don't do that! It would be better to find an artificial
car. Gotta balcony, or windows that open? Set the antenna
on the balcony, or window sill. Drop a 108" wire from the
base of the antenna, out the window (acts as a ground).
Almost anything is better than the 'back of set' type antennas.
'Doc
PS - 'Course, you could find an artificial radio and antenna
to go on that artificial car...

3921. Re: Amps

Newsgroup: rec.radio.cb

Jerry,
If the amplifier output is no more than 200 watts, and
if you hold a Novice, or higher class license, theres no
problem. If your a Novice, and the amplifier output is
greater than 200 watts, then you could be in trouble. Other
than that, unless they catch you in the act, no sweat.
'Doc
PS - Of course, if all you have in the car is a CB radio
and the amplifier... It'd be a little obvious, wouldn't
it?

>73 Rob KG4GGX

I don't know the specifics of this rig but the problem is that
the LSB intermediate frequency that is adjustable and must
pass through the crystal filter is in a bad position. Re-adjust the
frequency/position for a combination of power output/compared
to USB, proper fidelity/compared to USB, and adjust it so that
you don't get to much crossover to the opposite sideband.

This assumes that USB is correct. If it is, then use it as a
comparison to LSB.

The best way to own a Linear, approved type or not, is to not have or
be a CB'er or a Amateur.

I use to run one on 11 back in the early eighties.
The receive was good on mine but the AM is more like double sideband.
It drifted alot during the first two hours of use(most tube based
units do). The transmit relay was forever needing cleaning and or
replacing. I was getting approx 250 or pep.. AM was never used for
anything other than annoying the locals.

Hope that helps you decide..If it was me, unless I was getting a
REALLY good deal, I'd pass..

Klyben.

Source record: 37702

First of all I want to thank all who have offered their help here and by e-mail.

It has been suggested to me that for my prescribed use that the amp that would best meet my needs (10 meter SSB and 11 meter AM)is a Texas star,and I'm begining to agree.
So my question is this,I've narrowed it down to the 350 R and the 400 R.Is their any advantages/disadvantages to either of these two amps regarding harmonics,longevity or reliability.
Specifically,the 350 has 2X 2879 pill's and the 400 has 4X 2290 pills.Any input that you may have would be greatly appreciated.
Also,is the supplied coax on a wilson 1000 roof mount (no mag mount)sufficient enough to handle these amp's.

Again, thank you for you're time/expertise

Sully

All rights (If I have any left) are reserved.

3930. Re: (new Q's)Davemade and 3 pill and magnum 257 questions.

Newsgroup: rec.radio.cb
Date: 2000-05-29 00:00:00 UTC
From: Bill Eitner <kd6tas@freewwweb.com>
Message-ID: <39334F4A.8AF94318@freewwweb.com>
Source record: 37703

You basically answered your own question.

The 350 is a 2-pill and the 400 is a 4-pill. For SSB use with
today's more powerful radios, a 4-pill is a better match. With
the ALC bypassed, the output waveform looks very carrier-like.
In other words, it's a large, high duty-cycle waveform that
drives the shit out of a 2-pill. A 4-pill runs much more
comfortably with that kind of an input waveform.

Another thing to keep in mind is that the R series Texas Stars
switch in quite a bit of input swamping resistance when you
push in the SSB button. With most amps the SSB switch does
nothing more than switch in a delay that keeps the relay from
chattering. Input swamping resistance helps to prevent the
big SSB input signal from overdriving the amp--so it's a good
thing--but it also reduces the maximum output. So, you'll
want to go with the bigger amp so you won't be disappointed
by the lower peak output on SSB. You originally were interested
in a one-driving-two Dave Made. That amp is likely to be good
for about 500 peak watts at normal voltages and drive levels.
The equivalent Texas Star is the 500--that's why I originally
recommended it. The 400 is a decent amp, but the 500 is a
classic. It's alot of people's favorite amp. It has a ton of
gain but it stable, and it produces a satisfyingly high level
of output for its transistor compliment. With the SSB switch
in and normal drive and supply voltages, you can bank on a
consistent and reliable 400 out. The 350 and 400 outputs will
be quite a bit lower. You could bypass the swamping resistance,
but you really don't want to do that if you don't have to. Run
the amp conservatively and it'll sound cleaner and last longer.

I hope this helps.

Hi Steve , and all those that responded

Power is measured on a dummy load and a tuned parallel dipole with a low swr.I realize the rig will fold back when transmitting into a high swr.After I tuned the RF unit by the manual ,and set the power to 100 watts in cw mode as the manual says by adjusting VR-06,the rig still has to struggle to get 80 watt on 40 and 80 meters.It does 100 watts with no trouble on 18,15,12,10 meters.That is modulating the rig into a dummy load.Also I noticed it gives more modulated PEP in upper sideband than lower sideband on 40,and 80 ,again into a dummy load of 50 ohms on a peak reading meter with a 1.1 to 1 swr,and rated for 300 watts.The rig will give 100 watts on all bands in cw mode, but not in lower sideband with modulation on 40 and 80 meters.It responds much better to audio on upper sideband on 18,15,12,and 10 meters.

Thanks for your responses

Unless you have a VERY strange T496 it isn't diode matrix. It uses a
module with two 2716 EPROMs

If it is making 100Watts on all bands with CW, you made need to focus on the SSB modulator circuit. There are usually 3 carriers generated in the low level modulator. One in the center of the IF filter passband for AM CW and FM and two other for USB and LSB below and above the IF center frequency. One thing you might try is using USB on 40 and 80 and see if there is a power difference. Check the IF carrier frequency generated for LSB, the offset may be incorrect. Another quick way to check the offset is to listen to yourself or have some else listen to your audio on LSB and see if it is excessively bassy or tinney.

Hi Professor--long time,
I agree that's its probably not possible but I found the following at:
http://www.mustangworld.com/depart/qna.htm

"I have a CB radio with a 120 watt linear amplifier, can this damage my ECC computer ?

Yes it could. If you "key up" with full power on your CB & linear (100w or more), the RF "may" damage your ecc computer. To reduce the chances of this happening, wrap the ecc in tin foil or other RF shielding. Run the CB radio cables as far away from the computer as possible. In the past we damaged 2 ecc computers accidentally by not shielding them"

Get a life Jerry....and I have seen Hams splatter harmonics worse than alot of CB's with linears behind there CB's do. Some of us ARE Ham radio operators..me included..seeing BS like this from a fellow "ham" shames me to no end!!!

Oh yea I get it...he gets his HOLY Ham ticket and then he runs a 175 amp on 10 mtrs and poof no problems just because he is legal...Yea right!!!! Why don't you become a "Elmer" for the guy? Then he is going to think...hey this guys pretty smart..I wonder why he knows so much..maybe there is something to this ham thing...If all he is see's are dickheads like you then who could blame him for not wanting to be a part of Ham radio??

Sorry gang...but BS like this PISSES me off to no end. One of the reason I am a non-active Ham is because I do not agree with 80% of the Ham radio operators out there today. Ticket is still good but put on the shelf for now!!!

Thanks for the support guys. The radio is wired straight to the battery and so was the amp. The Ham guy was right though at 4 watts I would not have any problem . I thought the amp may help if way out in the woods and can't get a cell phone to work, but if it will run the risk of killing the motor it is not worth it. I did not want to start a feud between hams and c.b.ers

I have been using a modulator bull whip on a mag mount on a biscuit tin for over 5 years. Ok it is not great but I seem to do ok. Although I use FM UK channels mainly, when I do use AM and SSB everything seems fine. It IS possible to get a reasonable VSWR as well or you could buy a matcher!!

Just a thought here, what about your VSWR? If that is bad then emissions can
do strange things. I used to be able to make my VCR turn on, rewind and
eject by keying up and that was with 4 watts on the FM UK channels!!!
Needless to say my VSWR was naff. Just an idea!!

Yeah, the Pace CB-1000M was a box of bad solder joints, as
were many other Pace radios. Junk from the get-go!

Hi Jay, I have a question...what does
'swinging' mean? is this something you
do to tweak the power? I am a ham radio
operator and have heard this term only
talking about CB's and truckers who
say 'it swings xx watts' can't really tell
me what it means. Thanks!

3955. Cobra 25 problem

Newsgroup: rec.radio.cb
Date: 2000-05-30 00:00:00 UTC
From: keeperof7keys@aol.com
Message-ID: <20000530100826.06272.00000960@ng-cd1.aol.com>
Source record: 37728

I have two cobra 25 radios with the same problem.This I have seen before but do not remember the direction I went in.The radio has no problem with receive.The transmit with carrier appears to be on frequency until I modulate.I was told ot sounds like I am oN another channel or I am on sideband.I checked everything(final driver and predriver)in the output circuit but the caps.Nothing is changed but the mod limiter in the audio cicuit.Tuning is very touchy and hard to lock in freq. Power will not hold on all 40.I did notice that when I unkey that the voltge on the final and driver spikes to 20 volts with my meter and drops off slowly.
I may be getting to the point that I have to write everything down but if someone can at least point me in the direction I need to go.Thank you in advance.

Source record: 37735

I`ve been wondering about this for a while.
Do the stick antennas "use" the metal mast pole that they are mounted to.
I was thinking about using one in a semi-mobile application on a fiberglass pole.
I was thinking about clamping one to a 40 ft fiberglass telescopic pole and mounting it to the bumper of my truck when I`m sitting still. Climbing to the top of some of the mountains in the Keystone State should provide some good range.

Lemme know what you think.

Darrin,

Back in my younger days in the UK, I ran a DV-27 mounted in the centre of an upturned biscuit tin in my bedroom. It worked quite well and SWR was not too bad. My mom thought it looked ugly, but she let me keep it as it kept me out of trouble !!

There is a Firestik indoor base antenna which includes ground plane radials (Firestik IBA-5 I believe). I have also seen a President antenna that looks like a satellite dish, but I have not tried either to comment. Also, there are balcony antennas and even short groundplane-less antennas that look like a vertical 4 foot rods.

Anybody else have any suggestions, as I am in a similar position with antenna restrictions in my area ?

Richard.

ANOTHER SS

why is it terrible man, JR, your attitude is why i won't bother using my
Extra class ticket and stay on CB, Instead......

Hey you bet that Drake will work on CB, its a nice old radio, yes you
may have to allow some time for warm-up...... But tune around and give a
listen on some of the other bands while your letting it warm up.. Not the
greatest on AM, but decent on SSB, you can't go wrong on the old rigs, value
just keeps rising. as long as your not paying an arm and a leg, i would
grab it!! This would be a great way to Ease yourself into a Ham license!
Not all of the Hams are like JR, a good percentage are SS, (Stuffed Shirts)
but not all! Yeah I'm trying to talk some good folks into becoming Hams,
It would be great if the SS were not the majority!

Best wishes, KW

Forget about the computer and check the basics. Is the altenator giving the proper output. If not the car will be runing of the battery, therefore the battery will be low. Keying the linear will suck the juice from the cars ignition system that it needs to keep it running. Simple test to check the altenator, start the car then disconnect the battery. There should be no difference in idle is the altenator is good.

Shouldn't be a problem at all. The metal pole is usually suggested for base applications where durability and some strength are needed, but the antenna does not "use" the metal for efficiency.
There is a product available (AES, HRO) that is a telescoping mast with a 'park-on' steel plate at the bottom, for just such situations as you are considering. So go for it!

Rich...
If you're interested in SSB CB, stay away from a 'regular' CB (one with
channels). Instead, get one of the 10/11 meter radios that have a VFO
(Variable Freq Oscillator)... it's the only way to fly on SSB.

What I've done is to put the mag mount on a piece of tin, and solder four radial wires to it at 90 degree angles. These radial wires should be about 108" long and optimally hanging at a 45 degree angle downward. String can be used to hold these in place. I had one in an attic once. Talked over 15 miles with it. You could also put a 3/8 mount thru the tin and use a quarter wave whip.

steve , you need a bigger alternator . goto napa or such and get one that puts out at least 90 amps . i am guessing your alternator right now puts out about 60 . and they usually put an alternator in a car thats 10 amps more than whats needed to run 100% of everything in the vehical .

they do sell rebuild kits that say they do 150 amps , but most are rated at 150 amps at running speed not idle , at idle most rebuilt alternators are putting out less that stock .

It will work indoors if you use radials or a counter-poise.

3980. Re: Do the "stick" antennas need a metal mast ????

Newsgroup: rec.radio.cb
Date: 2000-05-30 00:00:00 UTC
From: w5lz <w5lz@oio.net>
Message-ID: <393401D8.17B41E2D@oio.net>
Source record: 37753

LZBoyz,
It sort of depends on the antenna. Some 'may' use the
metal pole as a 'ground' connection, most don't. Even so,
a wire run to ground would serve the same purpose. Ought'a
work just fine...
'Doc

3981. Re: can a drake tr-3

Newsgroup: rec.radio.cb
Date: 2000-05-30 00:00:00 UTC
From: w5lz <w5lz@oio.net>
Message-ID: <39340463.39D064A4@oio.net>
Source record: 37754

Jim,
It's been a long time since I 'fooled' with a TR-3, so
with that in mind, I don't think the TR-3 would be a good
bet for you. I think it would require re-building the radio
almost. Depending on price, it may still be a good deal.
'Doc

3982. Re: Amps

Newsgroup: rec.radio.cb

From: w5lz <w5lz@oio.net>
Message-ID: <393406B4.44942BEB@oio.net>
Source record: 37755

tnom,
What I was getting 'at', was that since Novices are limited
to 200 watts, having an amplifier with higher output 'could' be
construed to make the Novice appear to be operating with too
much power. I doubt if anyone would say a thing about it though.
Also, if there is 'only' a CB radio in the vehicls, along with
an amplifier, you gotta admit that it would be a bit suspicious,
ham or not.

3983. Tuner +3/ 142 GTL wiring

Newsgroup: rec.radio.cb
Date: 2000-05-30 00:00:00 UTC
From: pkenn59788@aol.com
Message-ID: <20000530143525.14193.00000927@ng-fj1.aol.com>
Source record: 37756

I got a Tuner plus three that I would like to use with my Cobra 142GTL base.
The 142 uses a 5 pin plug and the Turner cord came with only four wires.
I have a 5 wire mic cord, but need to know how to wire the base of the mic, as
well as the pin out on the jack.
This Tuner has the relays in the base.
Can it even be done?
Any suggestions are appreciated.
TIA

Paul- CM2523

Although I don't know for sure, I do believe that in this case
you can have a larger than 200 watts amp as long as it's
a FCC approved type. You just can't go beyond 200
watts. Ha Ha All the amateurs I know ignore this 200 watt
limit.

> I doubt if anyone would say a thing about it though.
>Also, if there is 'only' a CB radio in the vehicls, along with
>an amplifier, you gotta admit that it would be a bit suspicious,
>ham or not.

Licensed or not you can't physically hook the amp to the CB.

If however a amp was unhooked but in the CB'ers car then it
should also be OK as long as it is an approved type and you
have a license.

Yea it will work however AM transmit is really carrier injected DSB, AM
receive use's the SSB filter and is muffled.
For SSB they good good after warm-up, it is also illegal on 11 meters
You will also need the external power supply

This guy's problem is on or all of the following:
1.Poor grounding of the antenna
2.High swr of antenna
3.Bad coax to antenna
4.High swr between radio and amp
5.Too small wire feeding amp
6.Not feeding amp from battery
7.Insufficient ground to amp
8.Insufficient ground from battery to frame
9.Poor grount to computer module

Addition.....
this isn't a battery or alternator problem. He's not running a kw box, but a 175w which won't pull as much as his high beam headlights. That won't cut the car off.

I need advice on a low or no profile antenna setup for my Chevy G20 van.
I don't want a magnet mount and I'm leaning towards the K40 roof mount,
simply because it detaches easily and what's left I can disguise somewhat so
that it doesn't broadcast the message " Radio inside, please break and
enter."
Another option is mounting a whip with a quick release on the bracket
which holds the spare tire on the rear door. When the whip is detached the
mount would be hidden, and most of the distance to the roof from there is
along a window.
I know there are probably better ways to go with performance in mind,
but I really need to compromise due to the theiving s.o.b.s who prowl about
my neighborhood at night.

Your a good example of what's wrong with people these days.
You take a fairly good discussion and turn it into a forum for
personal attacks.
Did you inquire if my TR-3 was in good shape, NO!,
Did you inquire if it was tuned to work on 11 or just re-crystaled?
NO!
Not even a thought, just attack, call names, insinuate and move on..
All your interested in is having your opinion excepted and not
questioned. While you personally attack everyone for theirs..

And by saying(so to speak) this, I have dropped to your level..
Now I am no better than you are..are you happy??

Hello ROBMURR: "Swinging" or swing, yeah is a CB term. If you look it up in the ARRL Handbook, it probably isn't there. It is truly a CB Folk Lore type term.

As a AM transmitter is modulated, the carrier power increases with the modulation. Swing is the measurement of the unmodulated to modulated power level, or something like that. No real world diffinition.

The Average Power reading meters like the Bird Model 43 are supposed to indicated a 100% modulated carrier at about 1.5 times the carrier power. According to the Bird data, I believe.

Be careful of what you get from Copper. The boards usually have similar schematics in all of them. Most of those radios are refurbished, anyway. Ranger, Galaxy, and Eagle are all connected. Uniden and Radio Shack are connected. Cobra is slightly different from Uniden (but not by much).

The K40 is ok, they work reasonably well, should work pretty
well for you as long as you never plan on running over a couple hundred
watts, anything over that and they'll go up in smoke (literally) If you
mount it near center of the van roof it would be much less directional than
the whip on the rear. For the price you really can't beat a 102 steel whip.
less than 20 bux... The Wilson 1000 or better yet 5000 Roof mount would
probably be your best choice, not quite as easy to remove, (Takes a few
more turns) but leaves about the same thing behind as the k40, and it will
handle a hell of a lot more power and perform better doing it.... Also my 2
cents on mounting a radio in the Van... Don't Hide the mount leave it in
plain sight, the the extra few minutes to remove it and either bting it in
the house or stash it in the van somewhere... an empty mounting bracket
with wires hanging is a great theft deterrent... Eventually if you leave
the radio in your vehicle those theives will be in it either way....

I would be very careful, there is very few quick-disconnects that will hold up to a 102" whip. In the tests I have done a Wilson 1000 on the center of the roof will out-perform the whip on the tire rack, If you mount the antenna towards the back of the van it will talk a little better out the front, keep you "signal" a little lower to the ground.

4038. another antenna question

Newsgroup: rec.radio.cb
Date: 2000-05-30 00:00:00 UTC
From: Killrwatt <killrwat@dwave.net>
Message-ID: <39346fcb$0$76058$4bb17d6e@news.dwave.net>
Source record: 37811

Hey all, here is the low-down.... my radio ride is a Bronco, Have the Antenna mounted on the light bar in center portion of metal roof! have a Wilson trucker 2k on it now... Have had lots of antennas in the past, one of the better was a Nugatron single large center loaded coil.. Now in my past tests between the wilson 5000 mag mount, the Nugatron on a triple magnet and the 102 steel whip on the trimag, The Nugatron had the slight Edge on both tx and rx, these tests were conducted in a stationary location within a few minutes apart. 3 different base stations #1 @ 5 miles, #2 @ 15 miles, and #3 @ 30 miles were used to measure signal, The bases had no idea what antenna they were rating. Now as i said the Nugatron edged out both other antennas, however it was so close that other factors would be used for deciding wich to use.. The reason i decided on the Nugatron was it was super broad banded, less than 1.5 to 1 from 24-29.5

I use that full range of Freqs, 12-10 meters Now a 102 is to damn tall, it bangs low bridges etc... the Bronco is pretty tall... So i most likely need another center load... The wilson is ok but it looks kinda wimpy and is too narrow banded, plus i've upgraded to a bigger box and the antenna probably won't handle the power! Now after all the Rambling... I've been looking at the various antennas on the net, 55, monkey, predator, Stargun, ETC. And i need a few opinions, I'm leaning toward a predator 10k but i need to here from experience what works and what does not! how broad banded are these......

I would buy another Nugatron but cannot find anyplace that sells them...

Help me out here!!

Thanks

KW

Dealt with copper before, but the last time I returned something they were ok about it. Never went with H&Y, seemed a little too shady for me. Complain to the FCC maybe, I got my recent catalog from them. I wonder if a little manilla envelope with a letter inside sent to the FCC would do. Probably nothing but worth a try.....

Years ago i used to deal with H&Y, The FCC has been on his butt on and
off over the years! I can't remember the guys name who runs the place,
think it was John... Anyway i quit dealing with him when i called to place
a rather large order and he insisted that He was not selling Radio gear,
never did, and never would! He went on to insist he sold nothing but
pornographic books!! Later i found out the FCC was breathing down his neck!
but i was an Established buyer who had delt with them for quite a while...
The moral of the Story is H&Y never has nor never will give two shits about
the customers!! look elsewhere!

Good friendly service is still around, harder to find but still
around!!!

Stephen,

Hey don't pay any attention to some of these immature children. You
have a legitimate post, Unfortunately, some people just seem to forget the
reasons behind this newsgroup and that was to help each other enjoy using CB
Radio and Ham Radio, to meet new people and to learn from each other. While
neither I or anyone else will apologize for these pathetic people, I hope
you were able to look beyond all the B.S. and get some help with your
problem. Just remember, check out your whole set up from top to bottom,
look into shielding for the computer.

Richard,

Can you keep a secret? (actually it is not a secret, but most CBers don't like to talk about it...especially those who sell or repair them). There are not that many different companies. Most CBs come out of one of several plant facilities world wide. If you have enough money you can have 10,000 or so units produced with your name on it. Minor differences only. Yours can sell for $99 each where as the national brand name of the same radio will sell for $199. Now people are going to flame me for saying this. They are going to give you all sorts of examples of how the "Montgomery Ward" version of the Cobra 140 is not as good as the "actual" Cobra 140. If you can afford it, believe them.

Just as an aside, and to give you an example. In the 1970s I worked for AMF in one of their bike plants. We would start a production run of 10 speeds and go for about 4 days, producing about 5000 bikes for Sears. At some point in the week the Sears order would be met and we would start on an order for Western Auto. The bikes on the line never changed. Same bikes. Just different pedel reflectors, handle bar grips, decals, and most important of all....name plate. But there was one big difference in the end if you were the buying public. Purchase that bike at Western Auto and pay $79. Purchase it at Sears and pay $179.

That is not to say the radios you mention are the same. Several years ago Maxon was building a lot of the "main" brand names. I had a friend who worked for them. I don't know if they are still the "big" boys on the block now though.

OK, flame me. Point out all the ways I'm wrong. Turn some of my general statements around so that they don't mean anything close to what I intended when I posted them. :-)

Well this is all that remains and it ALL has to go, so drop me a line if the price seems out of line. I'll even through in the shipping and insurance state side if the offer is good :)

Radio Shack HTX-212 2m mobile I give it a 7 as there are some minor surface scratches on the case. $125 obo

TrippLite PR-12 power supply, mint, very nice unit. $60 obo

MFJ-407C Deluxe Electronic Keyer, mint, bought but never got around to going for the code test. $50 obo

Bencher BY-1 paddles, same story as keyer $50 obo

Cobra 2000 GTL w/ extra speaker. With original box and mic. Also has D104 deskmike. Yes it does have the extra freqs and clarifier mod. $250 obo

my only question is that when you tested your antannas from a stationary
position,what type of antennas and radios did the bases have?
as you stated some antennas hear and talk better then others.
were the base radios and antennas all the same?

Be careful pointing out that the 102 ss can be beat by a shorter
antenna. There are still those among us that believe in the 102
ss superiority and that the world is flat.

my worst amplifier was my first, a homebrew 4 6JG6 base amp, ALL you SS out there get this!!! I was 12 years old and an elderly Extra class ham Custom built it for me!! LOL, he even knew i was going to run it on 11 meters!!! Man that was one dirty Amp!! knocked out tv sets for blocks!

My Dirtiest Amp though without question was a D&A Phantom Triple power 12 tuber! Went over to my Girlfriends house 8 miles away and she proceeded to tell me how she heard me talking to Bermuda... Mind you this is in a rural area where the TV stations signal was pretty light.... But still... That thing sure put some RF in the air!! I was 15 at the time and living at home, my mother had about 100 feet of that metal core clear plastic coated clothes line stretched between some trees, it was getting dark, I had the old Phantom just cooking!! looked out the window and that clothes line was Cherry red!! everytime i would key the mike it would turn red hot in under 10 seconds! Next day she told me lightning must of hit her clothesline!!

The problem with Griffey's amps is that he won't
let anyone other than his cronies test them.

Given that, and what I know of Griffey's ability,
his amps are no better than average. In other
words, at best, they are the equivalent of a
Blue Face or a Texas Star--at best.

These days most people use peak reading meters even on AM.
With a peak reading meter the wattage will always increase
with modulation. The modulation induced increase in peak
power is the "swing." When a CB operator says "it swings
xx watts" he's telling you what the maximum peak wattage
was under a certain set of circumstances.

I used to have a catalog from a place, i think it was pancomm, they sold plans and kits for various unique electronic devices.... one of them was a high output pulsed linear amplifier claimed to have been originally designed for military applications. Supposedly this device would give a handheld 100 watts output off internal batteries and was small enough to fit inside an average Handheld.... Sounds far fetched, guess thats why i never ordered the plans...

4056. Re: CB killing motor

Newsgroup: rec.radio.cb
Date: 2000-05-30 00:00:00 UTC
From: Killrwatt <killrwat@dwave.net>
Message-ID: <393499ec$0$76070$4bb17d6e@news.dwave.net>
Source record: 37829

get real! there is no reason why a couple hundred watt cannot be run 10 kc's away!! Just because its a cber does not guarantee that its going to be a splattering and full of harmonics! lets see 11 meters 27.185, 200 watts 27.185 is closest LEGAL neighbor.... then we move to 3.913 and we have some idiot running his pair of 8877's at 3500 watts out talking to his neighbor while a net is being held 2kc's away on 3.915!! now I understand that most cbs are run with way to much audio and probably most of them are over driven, However no matter how much you express your opinion and gripe about 200 watts those amps and MUCH LARGER amps are here to stay! Do you run around 75 whining about good'ol'boys running 3, 4, 5 thousand watts and more? Your "SS" attitude make no difference, your voice goes mostly unheard! My biggest gripe is that on a 1 for 1 basis the amateur bands are much more immature than the 11 meter band! i can tune around most any weekend and find a mature?? Hams going at it tooth and nail! Deny the accuracy of my statements!

Make sure the supply voltage isn't drooping too much on transmit.
Check it at the RF final transistor collector.

If the supply voltage holds, make sure the reference oscillator
and VCO are stable during transmit.

Next, trace the modulating audio's signal path from the audio IC
output through the audio output transformer winding and on over
to the RF driver and final transistors. Make sure there's no
distortion and that the carrier is not too low (less than about
2 watts).

I hope this jogs your memory.

This guy's problem is on or all of the following:
1.Poor grounding of the antenna
2.High swr of antenna
3.Bad coax to antenna
4.High swr between radio and amp
5.Too small wire feeding amp
6.Not feeding amp from battery
7.Insufficient ground to amp
8.Insufficient ground from battery to frame
9.Poor grount to computer module

10. TO SMALL OF ALTERNATOR . NOT ENOUGH AMPS

Had the deal with an amp. It went bad. Something wrong with a business who says they have a warranty and then tells you to send it back in a plain box with a $10 bill on top inside. Who in the world does business like that. And people wonder why companies get busted for selling amps. Sounds a little under the table to me.

Another bad deal with them was when they shipped the wrong items. They fought and fought till I told them I was going to call the BBB on them and then they came around to see things the way they should be.

They do nothing but give you the run around and sock it to you in shipping. This is the common denominator with them and Copper. Not having dealt with copper for 10 years because of back order problem I cannot give you a horror story there. I figured it out after the first order.

LESCO
RAMKO
A-1 Telecom

Barjan if you can stand their prices. No Frills. There are legitimate Wholesalers out there that aren't there to scam you out of shipping.

Good luck to all of us dealers.

What if your counterpoise is 1/8 wavelength radials?
Will you have non-zero current out at the end of the radials
as you do 1/8 wavelength up your radiating element?
The current must go to zero at the radial tips.
The only parameter guaranteed to be mirrored on the counterpoise
is the current entering it; not the current distribution.
If you have bilateral symmetry (as found in a half-wave dipole),
you can expect mirrored current distributions. Otherwise, there
is no way to predict the current distribution (except with a
complex electromagnetic analysis).

The really funny part about it is that they make you pay for the
privilege of getting screwed!

The least the smucks should do for that $25.00 WPBA "membership" fee
is to send a tube of KY gel along with the Amp fliers.

Copper Electronics, H&Y Electronics, Clear Frequency Communication, and
CEI are all owned by the same family of scammers. Newbees that are
enticed by their seemingly low prices need to get the full SHIPPED price
before they decide to take a chance with their legendary crappy customer
service.

Stuck On The Island

An ambitious yuppie finally decided to take a vacation. He booked himself on a Caribbean cruise and proceeded to have the time of his life... until the boat sank! The man found himself swept up on the shore of an island with no other people, no supplies... Nothing. Only bananas and coconuts.

After about four months, he is lying on the beach one day when the most gorgeous woman he has ever seen rows up to him.

In disbelief he asks her: "Where did you come from? How did you get here?"

"I rowed from the other side of the island," she says. "I landed here when my cruise ship sank."

"Amazing," he says. "You were really lucky to have a rowboat wash up with you."

"Oh, this?" replies the woman. "I made the rowboat out of raw material that I found on the island; the oars were whittled from gum tree branches; I wove the bottom from palm branches; and the sides and stern came from a Eucalyptus tree."

"But-but, that's impossible," stutters the man. "You had no tools or hardware.
How did you manage?"

"Oh, that was no problem," replies the woman. "On the south side of the island, there is a very unusual strata of alluvial rock exposed. I found that if I fired it to a certain temperature in my kiln, it melted into forgeable ductile iron. I used that for tools and used the tools to make the hardware.

The guy is stunned.

"Let's row over to my place, " she says.

After a few minutes of rowing, she docks the boat at a small wharf. As the man looks onto shore, he nearly falls out of the boat. Before him is a stone walk leading to an exquisite bungalow painted in blue and white. While the woman ties up the rowboat with an expertly woven hemp rope, the man can only stare ahead, dumb-struck.

As they walk into the house, her beautiful breasts bouncing with each step, she says casually, "It's not much, but I call it home.

Sit down please; would you like to have a drink?"

"No thank you," he says, still dazed. "Can't take any more coconut juice."

"It's not coconut juice," the woman replies. "I have a still. How about a Pina Colada?"

Trying to hide his continued amazement, the man accepts, and they sit down on her couch to talk.

After they have exchanged their stories, the woman announces, "I'm going to slip into something more comfortable. Would you like to take a shower and shave?
There is a razor upstairs in the cabinet in the bathroom."

No longer questioning anything, the man goes into the bathroom. There, in the cabinet, is a razor made from a bone handle. Two shells honed to a hollow ground edge are fastened onto its end, inside of a swivel mechanism.
"This woman is amazing," he muses.

"What next?"

When he returns, she greets him wearing nothing but vines and a shell necklace-strategically positioned-and smelling faintly of gardenias.

She beckons for him to sit down next to her.

"Tell me," she begins suggestively, slithering closer to him, "we've been out here for a very long time. You've been lonely. I've been lonely.

There's something I'm sure you really feel like doing right about now, something you've been longing for all these months? You know... "
She stares into his eyes.

He can't believe what he's hearing. His heart begins to pound.
He's truly in luck: "You mean...", he gasps, "...I can actually check my e-mail from here??"

COLD as ICE and TWICE as NICE.. Mr. ICECOLD BIG APPLE TREES says.. It don't mean a THING if you ain't got that SWING!!!!!!!

>On LSB/USB,I quite often hear people using station numbers, where do you get one of these numbers and who assigns them?<

Late at night , when all is quiet throughout the land and radio sets everywhere are cooling down the DX number giving fairy stumbles around after drinking Keystone and Boonesfarms(The preffered cheapshit of C.B ers everywhere)and will gingerly enter the back door of the double wide .And after groping your dog and raiding your fridge he will proceed to the bathroom.While in the bathroom he will wipe his ass on your bath towel and piss all over your toilet seat and make his way towards your bedroom.As he leans over your sleeping body that is recovering from a day of trying to find 2 used tires that match at the local junk yard and while drooling on your pillow in his intoxicated wine of a voice , he belches those magical numbers in your ear.And after looking for pocket change on the night stand and chewing gum on the dresser, he pauses in front of the t.v. set and changes the channel to the playboy channel(its been scrambled, because you don't subscribe) and looks over his shoulder eagerly trying to catch one glimpse of that one split second when an actual pair of boobs can be seen.Its been a long night and the DX number giving fairy has been gracious enough to visit your castle.So remember, every time you hear someone say AAAAAUUUUUUUDIOOOOOO, you know a dx fairy gets another 12 pack put in his fridge. Hope this helps, Captain Clam

> 11.9 feet is roughly 18 feet. 33% accuracy? (Wish you worked
> at my bank!)

I never said 11.9 feet is roughly 18 feet. You're confused.

Example 1 computes a wavelength for the signal *inside* the coax.
This is the normal, desirable signal feeding your antenna (or
carrying the received signal from the antenna to the radio).
These are "differential currents" (equal and opposite) which travel
on the center conductor and on the inside of the coax shield; the
electromagnetic waves for this differential signal reside entirely
within the coax dielectric. Thus, the much smaller velocity
factor applies. These equal and opposite currents cancel out
to create no net magnetic field around the coax.

Example 2 computes a wavelength for the current traveling back
down on the *outside* of the coax. These are common mode currents.
These "common mode" currents are different that the "differential"
currents within the coax. The current travels in one direction
with no equal and opposite current to counteract it. Because
this current in nonzero, it creates a magnetic field; the coax
is acting like an antenna.

Common mode currents are generally undesirable but can be significant
under certain conditions. What you typically want is the inside
shield current to be passed to the antenna ground plane or
counterpoise. Sometimes, usually because of a deficient ground
plane as found in a car with a fiberglass body, current cannot
or does not flow into a good counterpoise. Instead, it flows
back down the outside of the coax. It creates electromagnetic fields

traveling in free space; these fields are *not* traveling down the
dielectric within the coax. Thus, the velocity factor is close to 1.0.

> Using ex: 2, which is the electrical 1/2 wave length of
> 'ladder line', or open wire feed lines, then by your statement,
> 17.7 feet is roughly 18 feet. I agree. But how many people
> do you know who uses a ladder-line feed line on the CB band?

We are talking about signals in free space.

> As a 'rough' general rule, using the most common kinds of
> coaxial cables, your 18 feet of coaxial feed line bears no
> relation to an electrical 1/2 wave length. So, why would you
> want to use 18 feet?

18 feet is 1/2 wavelength to signals traveling down the outside
of the coax as these common mode currents do.

I hate it when someone tells me "read the book" because it is
usually a bogus response from someone who can't answer the question
but let me say this much. Common mode currents are real and they
are understood. They are pretty well documented in every Radio
Amateurs' Handbook including methods (see: "baluns") to reduce or
eliminate them. I don't make this stuff up. You should take a look
and try to understand these to improve your overall understanding
of antennas. Look at the articles about "baluns".

Why use 18 feet? Well, while I agree that 18 feet is 1/2
wavelength to common mode currents, I don't agree that that
length provides any guarantee of eliminating or reducing common
mode currents.

Those who believe the 18' claim, believe that it will block the
undesirable common mode currents. They believe that the high
impedance to common mode currents at the radio end of the coax
(which I contend does not exist) is repeated 1/2 wavelength (18')
up at the antenna to block the common mode currents.

You have to believe that the impedance to common mode currents
at the radio chassis is infinity to believe this claim. I don't
buy it. I contend that, with the radio (possibly attached to the
vehicle chassis), and microphone, and power cords (typically RF
coupled to the chassis), it is pretty much impossible to say that
the impedance will be infinity at the radio. Thus, there is no
infinite impedance repeated 1/2 wavelength up at the antenna and
nothing to reduce or eliminate the undesirable common mode currents.

> ...but when you come back to the 'real world', where things are not
> 'perfect', you have to deal with velocity factors.
>
> 'Doc

We *are* dealing with velocity factors -- the velocity factor of free space. Common mode currents are real and the associated EM waves travel in free space and not inside the coax.

Few people who know radios will agree that running 175 watts out of a CB
is anything but illegal and a nuisance to legitimate CBers. CB channels
are closely spaced and the use of too much power will cause interchannel
interference. Call someone immature because they jump on someone doing
something grossly (175 watts vs 4 watts) illegal and causes serious and
major interference to legal users of CB? Don't hand me that crap...
it's immature people who don't care about what their illegal linear amps
do (such as splattering, harmonics, splattering the signal across
multiple CB channels) to legitimate users. I'm a long-term CB user and
a ham... consideration of others is being mature, not caring if you run
illegal power and interference with others is not. To not criticize
something that harms *legitimate* and legal users would be taking the
easy way out.

> 'Doc
>Hey, if you can hack the weight of a sufficient power supply, like
maybe a gel-cell or a trolling motor battery, sure. Just be sure not to
use your body as the counterpoise (ground side) of the antenna. Any
real rf power might hurt. An Antennas West 'tiger tail' might help
here. Bear in mind that the shielding of the transmitter inside a
handheld radio may not be sufficient to keep the amplified RF from
disturbing the circuitry inside the handheld. The worst case of this I
ever encountered was the old Motorola HT-220 crystal-controlled
handheld radio. If you installed the optional 5-watt final and battery
in one of these, the RF would 'bleed' the mike amplifier/modulator and
distort the voice audio. This sounds like one of those "hey somebody
try this and tell me what gets fried" sort of questions.
There was an outfit named 'VoComm' that made a low-drive (1 watt or
so) amplifier meant to be used with a handheld radio feeding a mobile
antenna using the vehicle power. This was, of course, for 2 meters only.
We had a strange hitchhiker come through town a couple of years
ago that had a K-40 mounted to an aluminum backpack frame, a mobile
radio, gel-cell and 100 watt amplifier in the backpack. He used this
rig to solicit rides from passing truckers. I can't say how long the
amplifier stood up to this treatment, but he definitely found that a
power mike (or echo mike) just did not tolerate this setup.

I do not believe that the alternator is the problem the amp was fused at 20 amps inside the unit and I had a 20 amp fuse at the battery also. I could run all my accessories, fog lights, heater, stereo, high beams, break lights and not even a sputter. When I idled with nothing on and keyed up barefoot the tach would jump and engine sputtered, with the amp on it died.
I had good SWR at the radio 1.2 to one with maybe too short a patch cord to the amp of only 18" but SWR at that point checked out close to the same. I have also tried with a 3 foot cord with no difference.
I have a solid ground to the frame but did not try straight to negative side of the battery.
I was using a heavier gauge wire than was supplied with the amp.
It was a HD input Cobra 250 amp that should take 4 to 8 watts input.
The computer module bolts to the front fender with 3 separate screws. I did not check ground there.
The antenna is a 102" steel whip mounted to the right rear quarter panel on the back door stop.
The coax is old
Some people have suggested shielding the ECU that may be the answer but with what?lead sandwiched between foil? I guess I'll never know with the amp because I dumped it but if it works by fixing the barefoot sputter I let you all know.It may be of use to someone someday.

This tells me there's a aerious lack of ground somewhere, neg. of amp to neg.
of battery, 8ga ground from amp chassis to frame, ground radio bracket.

>The computer module bolts to the front fender with 3 separate screws. I did
>not check ground there.
First try an 8ga ground from ecu to frame, you can get sheets of heavy foil and
cover the ecu and ground that too.

>The antenna is a 102" steel whip mounted to the right rear quarter panel on
>the back door stop.
>The coax is old
New mini 8 (RG8x) coax, ground the ball mount w/ 8ga wire to frame.
Make sure all conections are bare metal, then traet to prevent rust or
oxidation.
You should be in business.

If it LOOKS box stock, great , but it can't truly be called mint.
Not trying to get into a scrape here, but the standard, accepted definition of Mint in most collector's circles is a unit that has never received ANY kind of overhaul or change in basic structure. A 60 year old player piano, while still quite valuable, will not be auctioned or sold as "mint" if it's been refinished and the keys/rollers replaced with modern stock. It'll be worth a lot to somebody, and deservedly so, but not "mint". In the case of the radio, It doesn't matter who did the mods or how well they were done, if it ain't factory, it ain't "mint". Do not confuse cosmetic "mint"-ness with integral "mint"-ness... It'll be worth a good deal, but not technically mint.

>channels). Instead, get one of the 10/11 meter radios that have a VFO
>(Variable Freq Oscillator)... it's the only way to fly on SSB.
>

In some people's experiences, perhaps, but hardly a truism. The Washington, while an "older model", will "fly" on sideband, has better receive than ANY RCI radio I've ever heard, and sounds nice and clear on transmit. If you buy a "channelled" CB base like the Washington, or the newer Texas Ranger TR696 base, you'll still "fly" on sideband without having to spend extra money tricking out the RCI stuff. RCI rigs tend to need realignment when new, and all the tweaking and tuning some of these guys are suggesting is not necessary on radios like the Washington. Stock power, a good mic, and a good antenna system (most important of all) will have you working sideband CB as well as anyone else, and better than most of the high-power-runners and tricked-out-10 meter runners.

No problem for those of us who only run SSB on the CB band.

If it is like the TR4, then modification is trivial - just change a
crystal.

:> > an external RF power amplifier.

This is also misleading. If the Ham is also a CBer, and there is evidence that the person used excess power on the CB band, then it does not matter whether the person has a license or not - they will still be ticketed for violating CB regulations.

If both have the same peak output power, then it does not matter if the amp has "swing" or not. This assumes that they are both operating in the same class with the same amount of distortion.

In general, the only real advantage of "swing" is to impress your friends.

"R. Ermish",
You might look for one of the brass post/sleeve quick
disconnet mounts. They're quite a bit heavier than the
usuall spring loaded disconnects, and should hold an antenna
on the 'spare' mount.
A 'stealth' antenna is always a compromise. They work,
but they aren't the 'best' in the world.

K-40 has a great antenna and super customer support.

The K-30 has in the past been consistent on reading short on vehicles like a van or large area metal tops.

We usually use a Wilson Lil Wil stinger to tune the antenna up.

Good price.
Average based on conditions 2 to 3 miles.

Just make sure it is tuned. It will perform the best it can given the situation you put it in. If you are going to run power, get a bigger antenna.

My brother recently got 2 old CB radios at a garage sale for $7. One is a Uniden PC-33 and the other is a GE model 3-5809C. We'd like to use these to talk to each other, but the GE radio has a problem. When you hold down the mic button, it does not transmit. The TX light will light, but it doesn't send anything to the other CB. The Uniden CB works fine (it can transmit to the GE radio).
My brother was told at the time he bought them, that the GE was fried because someone keyed it without a antenna connected up.
Because of this, I suspect that the final (C2078) and possible RF driver are dead. Is there anything else I should check for before getting the parts? Maybe a part near those have also fried?

PS, otherwise, the GE powers up, recieves, and turns the channels ok.

some GM Vans are a real problem when tuning SWR...My 86 cheve
was a nightmare from hell....seems the body isn't grounded to
the frame good (RF Ground) and running a wire to the frame isn't
the answer. I tryed side body mounts, roof mounts, front hood
mounts and about everything I could think of...VHF antennas (2-
mtr) worked real good anywhere you put it, but the 11 mtr never
would load right....finally tryed a wilson 5000 mag on the roof
about 2 ft back from the frome and it works great. but move it
a foot in any direction and its lousy again... seems that 2 foot
back from the front is right over one of the side braces in the
van...

hope this helps..

dave

I would say being that it does not sound like he knows very much about service.The best place to start would be both the driver and final.They do not cost that much.If there is another problem after replacing,check back.PEACE.And good luck.

Bill
Thank you for the advice.I di check to make sure the voltage was not drropping of on both the output circuit and vco circuit before posting.the audio circuit was not checked with the scope yet,but it was tested with a stock mic and dyna. at 9 oclock(around a 3).I will go back to it soon and recheck all of that though.
THANK YOU for the help.

I have been away from the CB scene for a good few years now, i have just got myself a Mini and i would like to fit a CB set up into it, the only thing is that i want the smallest antenna possible. Are there some real small ones on the market now. Even better, can you buy ones that go into the roof lining of your car???

Any help on this subject would be great as i dont want a huge twig on top of my poor little car :o)
Thanx...
Alan.

LOL, this guy must be out of touch! The equipment won't do more??????
god..... Ever hear of a pair of 4-1000's @ 7200 volts or so??? How about
an Alpha 77? or perhaps A Henry 8K Ultra? The only AC Amps that won't top
the LEGAL LIMIT are some of the vintage ones or some of the new BUDGET
AMPS... just look in AES's catalog, the description even says Legal limit+
only 65 watts to drive..... I hear guys constantly bragging about 4 or 5 KW
output...

>wave section.

No.

>What you describe is impossible with a series section.
>We were discussing the length of a series section of coax and your
>description doesn't indicate otherwise.

It is not impossible. Have you ever wondered why changing the
coax length can change the SWR null frequency at the radio?
Any one who has been into this HAS seen this phenomenon.

It is because IF the resonant antenna is not 50 ohms like the
coax, then a series 1/4 wave section transformation can take
place.

If this 1/4 wave section is cut to small or to long then
it will add ind. or cap. reactance. This additional cap.
or ind reactance can either add or subtract from the
reactance coming from a non resonant antenna.

It works out that a less than 50 ohm antenna that uses
a 18 foot section of 66% coax will increase it's bandwidth
measured at the radio.

A 50 ohm antenna will not show any difference with any coax
length at the radio.

A greater than 50 ohm antenna will show a narrower bandwidth
at the radio.

Source record: 37960

Hello Bill,
When in you're post below you stated you previously recommeded the 500 I didn't know you had in fact recommended it because my POS server is failing to show a shit load of replys.Now what I'm forced to do is check threads through Remar Q and I am seeeing replys I would normally have missed.
I think I will get the 500 and If I have to I'll just run it in a lower output setting with somewhere between 2-4 watts in and see how she runs. You have been a great help to me and if there is anything I can ever do for you just give me a yell.

Know what did I do with that phone number for exports are us :-)

Bill Eitner wrote;

You basically answered your own question.
The 350 is a 2-pill and the 400 is a 4-pill. For SSB use with today's more powerful radios, a 4-pill is a better match. With the ALC bypassed, the output waveform looks very carrier-like. In other words, it's a large, high duty-cycle waveform that drives the shit out of a 2-pill. A 4-pill runs much more comfortably with that kind of an input waveform. Another thing to keep in mind is that the R series Texas Stars switch in quite a bit of input swamping resistance when you push in the SSB button. With most amps the SSB switch does nothing more than switch in a delay that keeps the relay from chattering. Input swamping resistance helps to prevent the big SSB input signal from overdriving the amp--so it's a good thing--but it also reduces the maximum output. So, you'll want to go with the bigger amp so you won't be disappointed by the lower peak output on SSB. You originally were interested in a one-driving-two Dave Made. That amp is likely to be good for about 500 peak watts at normal voltages and drive levels. The equivalent Texas Star is the 500--that's why I originally recommended it. The 400 is a decent amp, but the 500 is a classic. It's alot of people's favorite amp. It has a ton of gain but it stable, and it produces a satisfyingly high level of output for its transistor compliment. With the SSB switch in and normal drive and supply voltages, you can bank on a consistent and reliable 400 out. The 350 and 400 outputs will be quite a bit lower. You could bypass the swamping resistance, but you really don't want to do that if you don't have to. Run the amp conservatively and it'll sound cleaner and last longer.
I hope this helps.

Thanks for the reply Advancespec. I under stand what you are saying, but I think I will get the 257 just in case for whatever reason I end up ampless for any period of time.
BTW could any of you give me the approximate dimensions of the Texas star 500?

Advancespec wrote;

If you don't need the 30W output of the Magnum you could by the 12W version of the radio for less money. Called either the TITAN II or the Superstar 4800,
it is essentialy the same radio without the dual finals. about $150.....

Remember I said ELECTRICAL quarter wave which requires the velocity factor
to be taken into account.
I don't think it has any effect on SWR bandwidth, it is just that an amp
likes to look up at a load rather than down at it. Same is true of audio:
an amp expecting an 8 ohm load is happier at 16 when all that happens is
that it draws less current than with 4 when it is trying to deliver more
power than exists and distorts. The effect is different at rf but it is
still better to look up at the load.

There has been a 'discussion' going on about whether shield currents are subject to velocity factors or not and I do not honestly know. The shield currents from a 1.5 SWR caused by 50 ohms looking at 34 are minuscule in any case. There isn't enough diff between voltage and current nodes at 1.5 to buy lunch.

At ODD (sorry, I should have made that point) ELECTRICAL quarter waves (nine feet times the velocity factor) you would get the effect of impedance transformation upward (50/.68 or about 72 ohms) which in and of itself doesn't change the indicated VSWR one bit. What does happen is that the finals draw a tad less current and that keeps the unit a bit happier.

An interesting side issue: Because the vf of RG8 is about .67 and IF shield currents are not subject to vf, then for RG8 there is some argument for 18 feet being the optimum. But then no one in his right mind uses RG8 any more. Could this be where all the bogus trash about 18 feet of coax doing everything short of curing the operator's corns and hernias came from?????

Dick

JarryLaw,

Please don't associate everyone in the newsgroup together when you make a statement like that. Not everyone thinks that way or feels that way. Personally, I believe in using the amount of power necessary to be heard. Not to step on everyone in a 5 mile radius. I run at 10 watts, I can talk to most people around my area, and if there is someone too far away and I have to talk to them, I drive my car closer to them. At 10 watts I am able to get over the static in my area, talk to people within 2 miles (on a bad day), my radio doesn't interfere with anyone else. So not everyone feels that you have to run 50,000 watts on CB.
But I am sure that there "SOME" people who do.

I'm in Az, and some truckers out here run linear amps on their CB's...esp. down in Mexico...they're a major PITA. There's a reason they're not legal...they blast away anything on the band, and can make normal communications on a frequency difficult.

My suggestion is to loose the amp, and operate the CB in accordance w/ FCC rules and regs.

The GE handheld may not be worth fixing if it's anything like the cheap
ones you can get for brand new all over eBay. Trying there for a new one
might be cheaper than trying to fix the bad one.

4153. Whips or Francis Antennas - Any Good ?

Newsgroup: rec.radio.cb
Date: 2000-05-31 00:00:00 UTC
From: Richard Smith <rsmith@planeteer.com>
Message-ID: <2eaZ4.4033$qS3.11100@tor-nn1.netcom.ca>
Source record: 38003

How good are the Francis antennas ? I have seen an 8 foot antenna advertised (model CB28 I believe) and was wondering how well they work when compared to other shorter antennas (Wilson, K-40) etc. From what I gather, the longer the antenna the better. Is this true ? Would a 102" whip out perform a Wilson or K-40 ? (Still considering various options for my loft mounted on a groundplane).

Richard.

4154. Coax Loss Question

Newsgroup: rec.radio.cb
Date: 2000-05-31 00:00:00 UTC
From: Richard Smith <rsmith@planeteer.com>
Message-ID: <1eaZ4.4032$qS3.11100@tor-nn1.netcom.ca>
Source record: 38004

Can anybody tell me what is the typical loss per meter or foot for coax ? I have heard that RG-8 is better than RG-58 (or vice versa, hopefully I have the names correct) is this true ? What would be best for a long run of coax from my basement to the loft of a two story home ? I am in a somewhat dense neighbourhood, so I am hoping to start off without an amplifier to avoid TV interference. Therefore an efficient transfer of output power from the radio to the antenna will be important. I am already having to contend with possible losses due to the loft roof (wood and shingles).

Thanks,

Richard.

4155. Groundplanes - How to design them ?

Newsgroup: rec.radio.cb
Date: 2000-05-31 00:00:00 UTC
From: Richard Smith <rsmith@planeteer.com>
Message-ID: <2eaZ4.4034$qS3.11100@tor-nn1.netcom.ca>
Source record: 38005

If I mount a mobile CB on a groundplane (instead of on a car), what is the best shape for the groundplane to be ?

- a flat surface ?
- a cross ?
- or the sort of tripod that I see many base antennas ?

Thanks,

Richard.

Cars with fiberglass bodies have metal frames and underpinnings which still represent a decent 'ground plane' if connected properly at the antenna (vs at the rig).

Rather than preach the '1/2 wave' of coax 'rule', why not eliminate the unwanted coax currents (& radiation) at the source (the antenna), either with ferrite chokes or a coax 'choke' designed for the freq. I can't beleive how deeply ingrained this 'magic coax legnth' myth is!

<< I was wondering can a DRAKE TR.- 3 be used as a CB base radio. I am very new to all this.. My neighbor has one he want's to sell to me but I am just not sure.. thank you for any help you can give to me...JIM>>

Assuming your neighbor is a ham, it sounds like he's the kind of ham certain others in this newsgroup HEARTILY approve of, i.e., one who sells an all-band HF ham transceiver to an unlicensed neighbor (admittedly a total newbie) for use on 11 meters.

thats got more to do with strong conditions than big amps. when the dx is high a barefoot radio from across the country can give you a s-9 and stop local comms. nothing you can do about that except hide your head during the peak years and come back out when the dx is down. but for guys like me and the others we do just the opposite. i'll be doing other stuff when the dx is gone like i did in 96, 97and most of 98.

So What?? Expecting him to repeal the laws of physics is expecting a bit too much.

Wander down to your local Toyota dealer. You will not see an honest innovation in the place; not a car in the place will win a race or an economy run. All you will see is proven designs executed flawlessly. Over at Honda, you will see much the same thing. The wonder of Budweiser is not that it is the world's greatest beer because it isn't but that is a pretty good beer produced in immense quantity with unmatched uniformity and quality control.

Only a total idiot would not be just a tad skeptical of Prof's claims; there are only so many ways to skin a cat and electronic laws don't change because your heart is pure. From what I can tell, all he did or in fact claims to have done is think the issue thru, keep it simple, and execute well.

You can see in the train shed built for the St Louis World Fair in 1904 a plaque from the American Society of Civil Engineers to the designers lauding their achievement as a "shining example of what can be built when price is no object" -- one of the world's great backhanded compliments. Price is an object; so is profit margin. There should be no doubt in anyone's mind that the usual design of bootleg amps starts with "what can I sell it for?", goes thru "how cheap can I build it", and ends with "how trashy can it be and still sell my production run?" The laws of economics don't repeal for the pure in heart, either.

Every design is a compromise with reality -- usually the customer's budget but often the customer's sanity and the repairman's ability as well. When you attempt idiot-proofing, nature merely invents a bigger and better idiot. Swamping resistors in SSB amps is the sign of schlock; depend on it. But given the customer there may not be a lot of choices available. Being pure of heart when your client is a knuckle-dragger is not the best position for a designer to find himself in.

So I will cut the Prof a bit of slack for the moment. When it is all said and done, he will either have designed a Toyota that amazes nobody but works pretty good or learned a whole lot about the practicalities of underground electronic design. Wish the poor bastard luck.

Dick McCollum

The ground plane attached to the coax shield should be:

1- Four wires at 90 degree angles to each other.
2- These wires should be 45 degrees in reference to the earth.
3- These wires are 108 inches long.

These conditions will be the closest to 50 ohms.

Good luck and happy modulating!

Bill's all excited about his new rifle. So, he goes bear hunting in Alaska.

The first bear he sees is a little brown bear, and he kills it with his first shot.

There is a tap on his shoulder, and he turns around to see a big black bear.

The black bear says "You've got 2 choices. One, I maul you to death or two, we have sex." Bill bends over for the bear. He's sore for 2 days, but he recovers and vows revenge.

Bill heads out on another trip to Alaska and he finds the black bear and kills him. At that moment there is a tap on his shoulder. A huge grizzly is standing right behind him. The grizzly says, "That was a big mistake.

You've got 2 choices, "Either I maul you to death or we have sex." Bill bends over. He survives, but he's really hurting and takes quite a bit of time to recover, and, he's outraged.

Sure enough, he heads back to Alaska and finds the grizzly and shoots him at point blank range. There's a tap on his shoulder. He turns around to find an enormous polar bear, and the polar bear says "You don't really come here for the hunting, do you?"

I don't see any logic here. I see no matching properties using a 50 ohm coax with an antenna, resonant or not, at any impedance.

The ultimate groundplane is about a quarter-mile round lo-resistance metal disk. Failing that, about 120 12-foot radials in a swamp works pretty good as well (visit a local AM station). As a practical matter, four 9 foot radials make a pretty good ground plane.

The tripod or 'drooping radial' design is used to raise the feedpoint impedance from the usual 34 ohms or so for an unloaded whip more toward the 50 ohms the transmitter expects -- helps the VSWR but probably doesn't do a hell of a lot for performance or hurt it much either. Whether you need to do that depends on the mobile antenna you have in mind. Be prepared to cut and trim and do it over when you get greedy and goof up.

Richard,
There can be quite a difference in losses between different types of coax. Until you get into the VHF region losses don't really make 'that' much difference (it does make a difference but not a lot in most cases). You can find feed lines that have a very low loss at HF frequencies, but they don't come cheap. There's a point where it just isn't worth doing any 'better'. Usually, RG-213 will work out fine for most installations. Using 'hard-line' would be better, but who wants to pay $3.00 per foot? The only thing I'd really warn you against is 'used' coax. It just isn't worth it, you usually inherit someone else's problems. Good luck.....
'Doc
PD - Remembered one more, do not be 'fooled' into buying RG-8M coax. This stuff appears the same as RG-8X, which is a good coax, but the 'M' version is for audio applications and is terrible for RF!

Alen,
There are some very short antennas on the market, but
just remember that they are 'short' on performance too.
There's just no getting around the fact that the bigger and
uglier they are, the better they work.

You lose, sort of. A quarter wave section (remember vf) of coax can be used as a matching device called a Q-section. A full-wave loop antenna has a feedpoint impedance in free space near 100 ohms. To match it to 50 one could take a quarter wave of coax at the geometric mean of the two (square root of 5000) which is give or take 72, put it between the antenna and 50 ohm coax, and get it done.

The point he is making is that if your 50 ohm feedline to the 34 ohms or less typical of a quarter-wave whip happened to be an electrical quarter wave the actual impedance seen by the transmitter might be in the vicinity of 75 ohms which doesn't help the VSWR a lot but is a whole lot kinder to finals and protection circuits. It is probably this effect that causes people to get all flustered about the length of coax to the meter, etc. without having the slightest idea what is happening.

Make any sense??

Dick

Source record: 38035

Killrwatt,
Basically all your saying is that people operate illegally
on both the CB and the ham bands. Nothing new there, and 'all'
people on the CB band don't operate illegally, just as the same
thing is true on the ham bands.
I agree, just because it's a CB amplifier doesn't necessarily
mean it's going to be 'dirty'. But, you have to admit that a
great many of them are. Thats usually through design of the
amplifier. The same thing is true of many amplifiers on the ham
bands. Thats usually because the operator doesn't know how to
run the amplifier. Different reasons, same results.
About the 3.913 and 3.915 thing. Thats just too close. The
minimum seperation is 3 Khz on SSB. Who is at fault depends on
who was there first. I don't mean 20 years ago, but today. If
the 3.913 bunch was there first, then the 'NCS' (net control
station) is in the wrong. If '15 was there first, then '13 was
in the wrong. Simple, spelled out in the rules. A real 'no brainer'.
I really don't see the difference in the two, CB, or ham. In both
instances, CB/ham, they're breaking the rules. If I had to 'point'
a finger, I'd have to 'point' at both. You know using an amplifier
on the CB band is against the rules, I know it, everybody else
knows it. Operating too close to another station on the ham bands
is wrong, you know it, I know it, they know it. People always
'push' a little bit more than what's allowed. Neither group can
point a finger at the other.

> watts. Ha Ha All the amateurs I know ignore this 200 watt
> limit.

Your right, as long as a Novice doesn't run more than his
'legal limit', it doesn't make any difference what amplifier
he uses. Sort of what I said isn't it.
>
> If however a amp was unhooked but in the CB'ers car then it
> should also be OK as long as it is an approved type and you
> have a license.

If you mean a ham/CB'er, your correct. If as you said,
a CB'er, then your wrong. Possesion of an amplifier by a CB'er
is illegal.

Bill,
Think about it. The FCC does not do random inspections
of CB'er. To do an inspection they have reason. If, with
reason, they do an inspection of a CB'ers station and find
an external amplifying device, Do you really think they're
going to overlook it? The FCC doesn't do any inspections
with out a complaint any more. The complaint would be the
'probable cause', and the existance of an amplifier on the
premisis will 'hang' you. "Sorry 'bout that!"
'Doc

It is not that is loud but that it "appears" loud because you have the carrier very low to keep the amp from blowing up.

hillbillydave,
Also had a problem with grounding. Did all the usual
things and things would work 'ok' for a while, then goes to
garbage. Finally used a copper 'flashing' strip and brazed
one end to the frame, star washers at the base of the antenna.
Works fine now. The newer cars/trucks can be a real pain.
It never hurt to bond all body panels to the frame. It's
lots of work, but it does help. NEVER use coax-braid for RF
grounding where the weather can reach it!

I'm not going to fight with you. I would just like to know how you know where my carrier is set at. I don't recall you ever doing any work on my radio. You of all people, should know that by lowering the carrie will increase your audio level. So how could my radio appear louder if my carrier was lowered? It wouldn't appear louder it would be.I will wait for your answer.

P.S. Why would anyone want a high carrie with a one pill amp. If I were to drive that amp with 5watts I would be distorted as hell. I would think the best place to drive a one or two pill amp would be around a 1/2 watt or so. Thanks for all your concern.

Doc, your exacly right! no arguements here!! the frequencys used were an example and in reality reflect no particular persons.. I agree totally! My beef is all the self appointed enforcement agents! Stupid responses pointing out this or that is not legal are neither usefull or wanted! And after all this is a CB newsgroup, if someone asks if a specific piece of gear is legal, fine point it out! If they ask a question about why an illegal amplifier is causing interference or whatever ANSWER THE QUESTION! Why bother whining about the fact that they are using the amp? 99.9 percent of the time the impotent ravings of the SS are ignored! My point is why try to clean up the city without starting in your backyard!

All I would like to see is encouragement rather that criticism.
Kind words go much farther than brash ones....

OK. I wasn't sure what "benefit" he was referring to.

So, what you are saying is that it is better to have a voltage
maximum at the transmitter than a current maximum. Better to
shock it than to short it. That's what I read.

But doesn't high voltage burn out finals, too?

4198. T-hunts and Directional Antennas

Newsgroup: rec.radio.cb
Date: 2000-05-31 00:00:00 UTC
From: justrichie@aol.com

I've been Lurking around here for about a week and have a question...
Does anyone out there T-hunt? As a young lad we used to run 1 live antenna and two dead whips on a car and do donuts to get a directional. Has the technology changed?? I know the HAMS are fairly hi tech, but what about us lowly CB folk?? What types of setups are you using??

Rich

If the antenna is a lower impedance at resonance (usually the case)
then the 30 ohm antenna hooked to the 50 ohm coax can use the
properties of a quarter wave transformer. Namely broadening the
SWR bandwidth at the transceiver.

Kinda..... If using an odd 1/4 wave multiple of coax.
When the antennas resistance at resonance is less than
the characteristic impedance of the coax, this being the
normal case, and if we move off the resonant frequency
we find this.
Because of the inverting action of a quarter wave
matching section, the added inductive reactance at the
antenna, when you go higher in frequency, is partially
canceled by the added capacitive reactance, that
comes from the former quarter wave section, that is now
more than a quarter wave matching section.
The same inverting action takes place if you go lower
in frequency. In this case the added capacitive reactance
at the antenna, is partially canceled by the added inductive
reactance of the now less than quarter wave matching
section.
The end result is an apparently broader SWR bandwidth
at the radio.

I disagree. There are two components being manipulated by
the matching action of the transmission line -- resistance
and reactance. While one gets better, the other gets worse
and vice versa. Thus, the SWR stays the same.

What you are saying, in essence, is that changing the coax
length changes the SWR. You are not changing the physical
length of the transmission line; you are changing the electrical
length by changing the frequency.

But the fact of the matter is that coax length does not change
the SWR. A 50 ohm coax cannot broaden your SWR bandwidth.

I'll even offer to demonstrate this with example numbers that
you provide.

Give me:
Antenna impedance at 26.5 MHz,
antenna impedance at 27.0 MHz,
antenna impedance at 27.5 MHz.

I will give you:
SWR at 26.5 MHz with no coax,
SWR at 27.0 MHz with no coax,

SWR at 27.5 MHz with no coax,
SWR at 26.5 MHz with 1/4 wavelength coax (measured at 27.0 MHz),
SWR at 27.0 MHz with 1/4 wavelength coax (measured at 27.0 MHz),
SWR at 27.5 MHz with 1/4 wavelength coax (measured at 27.0 MHz).

And, if I am right, it will show that the SWR with or without the coax is the same. There will be no broadening of the SWR bandwidth.

Hmmmm..... Does this mean I would have to perforate my roof x number of times to find the best location? Is it possible to test a location first (ground it somehow and run the coax in the door or window) to see how the swr would be, before drilling a hole?

Thanks all for your replies.

This is relatively simple. When you move off resonance the action of a FORMER 1/4 wave section is explained. It ADDS a reactance. This added reactance can work to broaden the SWR reading at the radio IF it counters the added OPPOSITE reactance of the FORMER resonant antenna.

It's simple. Try reading it again.

I can show you proof with a chart of the properties of 1/4 wave sections. It will however have to be scanned as a binary JPG. However I really shouldn't have to do this because I believe the explanation in itself should be sufficient to see how this action occurs.

I would like some feed back on how well this amp works and how big one is
I have one on order and I am just gathering all the info on it I can.

If you ever go to a keydown or listen on channel 6 you will see many
people run thier amps like this
mainly out of ignorane and lots like to see that big deadkey..

it doesnt mean it is right there are "maul" boxes out there where people run
big deadkeys and swing them bakwards

(Please do not reply to me or to the list.
Reply to Robert. Thanks.)

Please be on the lookout for these military radios
stolen from Robert Downs,
"ROBERT W. DOWNS" <RWDowns_WA5CAB@compuserve.com>
Of Houston, Texas. Thanks!

Groups,

The following items were stolen from my storage building the night of
29/30
May 2000. If any of you see or hear of anything, including someone who
suddenly has a complete SCR-284 packset radio, please let me know. The
Houston Police Dept. Incident Number is 68850900-D.

SCR-284 packset radio consisting of:

BC-654 Receiver-Transmitter s/n 47775 with J-48 key and PE-104 Vibrator
Supply s/n 52186.

CS-41 Bag containing GN-45-A Generator s/n 10214

BG-58-A Roll (Bag) containing:
2 GC-7 Crank
LG-2-A Leg
2 LG-3 Leg
4 LG-13-A Leg
IN-106-A Insulator
MS-49 through MS-56 Mast Sections plus extra MS-49 and MS-50
15' W-142 Wire

BG-102-A Bag containing:
P-19 & HS-30 Headset
CD-501 Cord
RL-29 Reel with CP-12 & -13 Counterpoise
RL-28 Reel with GY-11 & -12 Guy
T-17-D Microphone Contract # 10612-Phila-44
4 GP-27 Stake
2 PE-104 Vibrator Supply s/n 12424 & 4431

CS-76-B Bag containing RM-29-A Remote Control s/n 2504
BX-31-A Box, Spare Tube & Vibrator (fully stocked)

SCR-694 and AN/GRC-9 components:

CW-140/GRC-9 Bag containing RT-77A/GRC-9 Receiver-Transmitter s/n 4726
(all
3 tags match)

BG-175 Bag

2 BG-174 Roll (Bag) (one WW-II and one Korean War style) each
containing:
6 MS-116-A Mast Section
2 MS-117-A Mast Section
2 MS-118-A Mast Section (missing from WW-II bag)
CD-1086 84" Cord
2 GC-7 Crank
IN-127 Insulator
LG-2-B Leg
2 LG-3 (WW-II) or 2 LG-3-B Leg
1 GP-27-A (WW-II) or 4 GP-27-Fr

For the four of you who noticed that there are three PE-104's with the
SCR-284, the two in the BG-102 are filling the space that should be
occupied by two BA-43 Batteries, which are made of unobtanium.

Robert Downs

The picture he posted (sideview.jpg) was taken at 12.44:26 PM on
May 14, 2000

It was taken as he said by a Kodak DC265 Zoom camera.
1/60 shutter speed, Aperture 1:2.8, 24mm zoom, with flash

It is a legit picture, not a copy.

4222. Needed 2510 Doctor

Newsgroup: rec.radio.cb
Date: 2000-05-31 00:00:00 UTC
From: rgray@kc.rr.com
Message-ID: <dEhZ4.51369$_I1.345116@typhoon.kc.rr.com>
Source record: 38122

I bought a HR2510 which was claimed to me in mint condition...yea right..anyways I am now stuck with it..I have no manual for it..would like to have that...plus the speaker has been cut for some unknown reason and a external jack has been jackleged out the back of the radio...plus it sounds like total crap on the SSB side. On AM it is fine...I do not have enough tech know how or equipment to tune and align this radio..was wondering who is a good shop to work on this radio? Or is it somethihng simple that I can fix?

Thanks guys for the help...

Ron

Sounds like what was happening was you were not on the same frequency... Is this possible?
The RIT may only have a limited tuning range... perhaps +/- 3KHz... and just maybe... you were 5KHz away from the other radio.

yes it is possible to check for the best place without
drilling....use a magnet mount antenna and move it to different
locations....where it works best is where a permenent mount
would work best....

This will make your radio sound louder to a local station, if you run your
carrier down while talking to a distant station the guy in the distant will
tell you it sounded better hen you had some key, do the math and then look
at it on a scope, the audio only diminishes when the key is run real high.
>
> P.S. Why would anyone want a high carrie with a one pill amp. If I were to

so.
> Thanks for all your concern.
If the amp and radio is done properly it will not sound destorted at all, I
can key say 3000 swinging down to 2000 on a bird and if you were to hear me
in DX you could not tell by the sound of it that I was running a high key,
if you don't believe tell me a channel and a time and I will do my best to
be there and show you what I mean, Now I did not look close at his pictue of
his one pill before it was gone off of the NG but it looked to me to not
have bias, it looked to iether be grounded or floating, you should be able
to runn a 100 watts key and still sound clear as a bell.

I have never heard you, and I doubt you can put a maul down like 5-2-2 can,
I doubt very seriously you have ever even seen a 10000 watt slug bang the
right hand side of a bird meter, get out the middle of the road before you
get your brains beat in duck.

Now that I think about it you are right. When I did have my carrier way down I was well below the channel noise. Like you said I probably did sound way down in the mud to him if he was way out there. When I talked to people in my area they said it was louder with the carrier down but you do need to have a little punch to the radio. I guess you learn something new everyday...eh. Thanks for all the input =BOO<>BOO=-

It sounds like you are saying that theory doesn't support it but
you've seen it.

> This shifting of the apparent SWR null point is explained by the
> action of a 1/4 wave section of coax and how it can interact
> with a non characteristic impedance load.

By "SWR null point" do you mean the frequency where the SWR is
minimum? If the real SWR never changes, how can the "SWR null
point" change?

have a Brand New Antron 99 forsale. Comes with 20ft of Koax. I already have an Antron 99. I just bought 20 ft to test it on a 10 ft mast pole, I talked to a trucker 3 miles away on it. Does very good with a good radio. Email me if interested.

Antron 99 - $35
KOAX - $5

Total = $40 plus shipping

TX sounds bad..and I agree I think a magic screwdriver was at work turning pots!! Now I am waiting trying to resolve this..I am not crying I knew the odds of buying used sight unseen....but in the past I have had good luck doing this..Bought a MINT STOCK Uniden Washington base pretty cheap this way. If I cannot get it done the way I want then I will send it into a good shop and have them work on it...I want to be really carefull about which shop as well..I DO NO want a radio hacker with a 20lb sledge to "tweak and tune it"

Thanks

I don't think anyone was suggesting you are stupid! :-)

Why not record the position of the diodes, then change one and see by
how much the frequency changes. Put it back, then change another and
see again by how much the frequency changes, and so on.

After a while, you may find a pattern will emerge, and you could maybe
work it all out for yourself.

Well it seems like a better idea than simply throwing it in the bin.

73, Chris

Yes, but the reality of the matter is that there is no path for DC
through the radio. Even if the antenna is permanently mounted. If you
want to waste time and money putting a fuse on the negative side then
more power to you.

Hi Richard,

I think the others pretty much answered your question. I'll just add that I have a preference for Times Microwave LMR400 cable. This is a superior cable to RG213 and more akin to Belden 9913 - it is also more expensive than RG213, but not by much. I believe it has some advantages over Belden 9913 as it will not draw in moisture and can be bent and twisted more without fear of damage. Some RG8 cables, particularly the cheap ones, have very minimal shielding. This will leak RF energy and will increase the possibility of causing interference to your neighbors. The LMR400 is 100% shielded. A good price is about 75 cents a foot. I've lived through causing all sorts of grief to neighbors with my rig. If you start out with good quality equipment you can save yourself a lot of headaches.

MC

Please describe the antenna you're using and where you have it mounted.
I have run into similar situations and all were resolved with relocation
of the antenna and a VSWR adjustment.

RCI 2900
RCI 2950
RCI 2970
RCI 2980
RCI 2990

Shield & Blue Pin 1 Ground/Earth
White Pin 2 Audio
RED Pin 3 Transmit
Black Pin 4 Receive (2950 only else N/C)
Yellow N/C (For up and down button)
Black N/C (For up and down button)

On mics with up and down channel buttons, connect
Yellow to pin 6 and Black to pin 5 else N/C for either

Mobile Max:
Block connnector at front right of box for mic wiring.
From left to right with front of Mobile Max facing you.

1. Common (black wire)
2. Transmit (brown wire)
3. Receive (red wire)
4. Audio (yellow wire)
5. Shield (White Wire)
These are the same for the back Block connector (pass-thru)

Back of Mobile Max to 6 pin connector (to radio):
Blue & Shield - Pin #1
White - Pin #2
Red - Pin #3
N/C - Pin #4
Black - Pin #5
Green - Pin #6

Front Wires To New 6 Pin (male) Mobile Max connector:
White & Black From Front Block - Pin #1
Yellow From Front Block - Pin #2
Brown From Front Block - Pin #3
N/C - Pin #4
Black from back Mic wire (remove from block and make longer - Pin #5
Green from back Mic wire (make longer) - Pin #6

The Black and Green Wires from the back are up and down channel wires
The Black wire going to the back block is removed from block and
extended to front along with the green wire.

The Front block red wire is removed leaving the number three position in both blocks empty.

Have the following for sale:

Browning Golden Eagle Mark III. 23 channel base modified to 40 channel with VFO. Works fine & is run daily. Very nice condition, original stock mike base missing but replaced with hand made wooden base w/Eagle. Although works cannot guarantee after shipping so being sold "as is". $350 firm plus shipping.

Cobra 2010 base station. Beautiful condition, peaked & tweaked. Stock desk power mike. Panel lights are burned out but other wise in perfect condition. Includes weather channels with automatic alert and installed voice processor. $300 firm plus shipping.

Uniden President Madison base station. Works great (including all clock functions), peaked and tweaked. Includes President external speaker and D-104M6 Astatic hand held power mike. $200 for package or $150 w/o mike - plus shipping.

3 Great radios all look great and work great. No auctions, no haggling. Email rclanton@nii.net for details. Payment to be money order sent in advance for full amount.

> The tragedy of this is that some of these guys actually believe this
> bullshit.

Its not Bullshit as you so eloquently put it... Spend some time
listening on the bands as i do, you may be surprised!

If 'most' amateurs were operating over the legal limit, then
> there might be some amps sold or resold on the market that were capable.
> There aren't. The largest single manufacturer of amps for the amateur
> market is Ameritron/MFJ

This is a really lame statement!!!!! MFJ/Ameritron Happen to be the
Budget amps i spoke of! However Even Ameritron makes legal limit+
following is quoted directly from AES catalog page 78 winter 99/00

AL800H 2x 3cx800a7's giving 1500 watts plus <==(notice the plus)
AL1500 Single 8877 gives you the full legal output and it's just loafing
because
the power supply is capable of 2500 watts pep
AL1200 1x 3cx1200a7 it can deliver the power of more than 2500 watts pep

3 out of 7 ameritron AC amps are capable of power levels in excess of the
legal limit.

, and the bulk of their equipment runs on 572b,
> 811, or 3-500. Even a pair of 3-500's will not exceed 1.5 kw on a good
> day.

Well 4 out of 7, sure i guess we could call that the bulk!

Henry? Who buys a Henry except a CBer? An amateur with a Henry is a
> novelty.

This is a really good one!! The last 2 henry 8K Ulrtra amps i've seen
were sold to Hams. I personally know 3 hams in my area with Henry's My
Henry I had was purchased by a HAM... I'm sure some of the Henrys have
landed in the 11 meter environment, however i think calling a Henry in a Ham
Shack a novelty is slightly ridiculous!

If you actually believe that 'most' amateurs are doing this,
> then where are the amps coming from? They aren't home brew for the most
> part, so tell us, where?

Gets better and better! Most Hams who HomeBrew an amp build them quite
conservatively. I know very few who would build a legal limit class amp
that would knock its guts out to make 1500 watts! And YES quite a number of
us DO homebrew! And again, Alpha (ETO), Henry, Ameritron all sell legal
limit + amplifiers! Here, click the lick and browse!

http://www.altavista.com/cgi-bin/query?pg=q&sc=on&hl=on&act=2006&par=0&q=HF+Amplifiers&kl=XX&stype=stext

A friend of mine operates barefoot and has for
> many years. He has 327 countries confirmed with 100 watts. What does he
> need an amp for?

I know Hams who have acomplished more with much less power, that has nothing to do with the fellows running 3,4,5 Kilowatts... An Amp is not for everyone, but thinking that most hams never put those amps above 1500 watts is plain silly! if it were done properly you would never know!

Something with 1 kilowatt would be nice to break a
> pileup to a rare dxpedition, but he is patient and as the pileup quiets
> down, he works the station.

Agreed, But if you think that those fellows your waiting on are all running legal limit or less you sir are indeed gullible!

This is just another concocted excuse for a
> few of the boys on this newsgroup to do some back slapping and try to
> convince themselves that what they do is OK because operators in other
> services are permitted more power.

You can make all the statments you wish, All i've stated is clean up The bad apples in your own barrel before trying to get to the bottom of your neighbors!

Well 73's I'm off to get a couple hours in on my Amp project, Guarantee it will loaf along at 1500 just like the others!

Sorry should have expanded on this I guess :) Really fuzzy and not able to tune in with the RIT at all...does not sound over driven however...just really really hard to understand what the person who is transmitting is saying...checked this with a new RCI 2950EX HD , a 20+yr old 148GTL , a Uniden Washington (stock) ...the 2510 sounded the same with all radios.

Thanks

Ron

The rule hasn't changed. There is STILL a 200 watt limit. Since you say that MOST other amateurs you know violate the 1.5 kilowatt limit, just how many of THOSE do you know? I'm in a large city and know of no one who operates more than 1200 watts. The equipment won't do more, and if you can't work the station even during a pileup with 1200 watts, then you aren't going to do it. You know the rule about S-units and watts PEP, right?

>kW PEP.

>This above also is not followed by many>>

Forget it Gary. You're likely dealing with someone who listened to one amateur frequency once for a few minutes and now thinks he's got ham radio ALL figured out. Just because his idiotic friend Clem happens to have a ham ticket and runs his amateur gear on 11 meters, he figures that EVERY ham in the universe is probably like Clem.

In the mind of a fellows like Tnom, wattage is EVERYTHING, RF power is THE HOLY GRAIL, ergo, every amateur MUST be running THOUSANDS of watts ALL THE TIME because otherwise, how would they be heard, right? Tnom thinks the first thing every ham does when he gets his ticket is rush out and buy a Henry 4K and start bashing the bands with it. (Because, of course, that's what HE would do)

If this misconception wasn't so pitiable it would be humorous.

You've got to be talking about a quarter wave stub across the
antenna connection (a parallel connection) ; *not* a series 1/4
wave section. What you describe is impossible with a series section.
We were discussing the length of a series section of coax and your
description doesn't indicate otherwise.

So, what's the deal-e-o? I say post the JPG image.

: It is not impossible. Have you ever wondered why changing the
: coax length can change the SWR null frequency at the radio?
: Any one who has been into this HAS seen this phenomenon.

It doesn't change the minimum SWR frequency. If it does, then the
coax is acting as part of the antenna system - not a desireable
occurance.

: It is because IF the resonant antenna is not 50 ohms like the
: coax, then a series 1/4 wave section transformation can take
: place.

Not if the transmitter output is 50 ohms and the coax is 50
ohms. No matching can occur. You need a 1/4 wave section that
is approximately half way between the 50 ohm output impedance
and the impedance of the antenna.

For a 100 ohm antenna, this is easy, as 72 ohm coax exists.
If the antenna impedance is 30 ohms, then no appropriate coax
exists.

: then the 30 ohm antenna hooked to the 50 ohm coax can use the
: properties of a quarter wave transformer. Namely broadening the
: SWR bandwidth at the transceiver.

I have never seen a 1/4 wave transformer to do anything here, if
the transmitter is 50 ohm. Now, if it is 70 ohm, then the 1/4
wavelength of 50 ohm coax would do as you state.

I didn't recommend it because of that.

I recommended the 500 because it was close to what you
originally desired (a 500 watt one-driving-two Dave Made).

The 500 Texas Star is a classic amp that everyone should
have tried--you're not special or different.

> Now what I'm forced to do is check

On SSB run it with the SSB switch in.

Who can answer this question please, I was looking at the Eimac specs for various tubes and I noticed that between the 3CX nad 4CX there was a difference. The difference was in amplification factor, the 3CX had up to 200 times amplification factor were is the 4CX only had 4.3
The 4CX had more output watts but less amplification factor. Can someone explain this? and what's the better tube and why?

thanks,
KRS

of
> the house ?

Sorry I didn't connect all the posts together. You, sir, have one hell of a problem. Let me give you a few of the design problems in a general way and a few possibilities that might help without seeing your house first hand.

The problem begins with a basic fact: the input impedance of the Universe is 377 ohms. Any antenna is a probe into the big waveguide called the planet, no different in principle to the stub on top the magnetron in your microwave oven. To be propagated, the static (voltage) and magnetic (current) portions of the wave have to be in that 377 ohm relationship. Now if you wonder just how a whip with a 34 ohm feedpoint radiates at all, it is by having a 'near-field' of waves more or less standing around looking stupid until that relationship is achieved. In an indoor situation, this near field tends to get into trouble heating up nails in the wall or roof rather than do a lot of useful things for you. So, in general, antennas tend to work a lot better when there is not anything around. If you can get it outside and away from any metallic siding, you will be better off.

The other alternative is to cut down the near field. The traditional approach here is the full-wave loop and its degenerative case, the folded dipole or the folded unipole or hairpin that you see on firetrucks and on top of towers running UHF. By running a loop, currents are cut in half with a resulting decrease in the near field and also tend to be broader between

2:1 SWR points. Radiation efficiency and broad response do not generally go together -- the broadest response comes from a dummy load so if your antenna is excessively broad, you can bet some nails are being heated.

Your aluminum siding presents some difficulty both as a major source of near-field heat and as a diode harmonic generator where connections are not good and moisture lurks but you may get lucky and you have to deal with it in any case. On a house with regular siding I once ran a loop in a point-down triangle supported by the eaves (on TV stand-offs) that ran pretty decently about 2-3 feet from the sides of the house and coming within 8 feet of the ground. By the way, there is no foreshortening effect on loops so start with a full 11 metres of wire at a 27.2 design point; any trimming you do is indicative of coupling to things. I would personally not fiddle with baluns, just feed it with 50 ohm coax properly weather-sealed of course; your feedpoint should be in the 70 ohm range in any functioning system. See if you can arrange to hang 36 feet of wire in a circle, triangle, square, hexagon or some other reasonably regular shape.

In the attic or loft, think of a folded dipole or even tripole or you will have some very warm roofing nails. In theory, a folded dipole has a 300 ohm feed point; yours will be closer to 200 and a 4:1 balun can be made out of an electrical half-wave (e.g. 5.5 metres times the velocity factor of the coax) simply by running the balun from say the left feedpoint where the coax from the rig attaches over to the right feedpoint and tying all the shields together. Doing all of this with a plastic block and soldered lugs is recommended. Keep the whole shebang as far from the roofing nails as possible -- give it a fighting chance. For indoor use, 18 feet of radioscrap (or even Walmart) 300 ohm twinlead makes an admirable folded dipole and gets you on the air while you figure out a better solution :=).

So that I can sleep tonite, we also need to mention that the tips of any antenna are voltage nodes and can give the unwary a nasty rf burn and have been known to start fires in rare cases so pay some attention to where the tips are and how they are supported. Folding also cuts these voltage nodes in half but pay attention anyway.

I think you may in the long run of things be happier with a balcony installation (loaded flagpoles are a standard stunt) again trying to keep your family alive in the process. At some time, you are going to want to run some power or get greedy and attempt a folded tripole; that will wait for another day.

Good Luck!

Dick

Are you reading the spec sheet correctly??? In EiMac nomenclature, the 3s are triodes and the 4s are tetrodes so the spec sheets probably do not line up with each other. As for what is better that is a question that comes later in the process that begins with just what it is you propose to do, what do you propose to spend, and whether you really like three-phase power coming into your house.

Read the poop sheets again and see if your result is consistent across all the 3s and 4s with comparable plate dissipation ratings and under comparable operating conditions. Something ain't right.

Dick

Message-ID: <39364BC4.52CF38DD@island.net>
Source record: 38051

The only time I used a coax to help was
in the form of a tuning stub. An Old
friend of mine... a number of years ago
bought a ford PU and put a large camper
on it. He insisted on using his SS whip
mounted on the spare tire rack in front
of the grill. The SWR was OK but the
antenna would not load. I can't remember
the measurements for sure but the stub
was attached to the feed line about 2 or
3 feet from the transmitter, a T put in
and a 3 foot tuning stub connected to
the tee. I kept shortening the stub
which was shorted at the end until the
antenna loaded to the radio's original
power with a SWR of 1.5:1 He never
complained about getting out so it
worked. I thing I have the specks buried
some where.
Cheers,
John

The diff is the newer model with the Automatic Squelch Control is the LT.
Same thing other than that. Just don't buy a 148--they is made by jack
booted Communist murdering THUGS and we don't want to support their shoddy
made pinko CB's, or anything else they made, despite what bill clinton &
congress say!!!
Dave!!!!!

OK, you tech - no - geeks, I will ask it again.

What is the most amount of AM power that you can put into a Dave Made M-400 (I think that was the model #) safely that won't blow it. What does the manuf. say?

Now to you CB NERDS that don't know or preach other numbers, I KNOW that Texas stars take 4 watts, all others 5 watts. Hi drives take 10 watts. These are ALL dead key numbers. If you don't like these numbers, then you have a problem with the manufacturer, not me. YOU have the problem!!!!!

So is Dave made 5 watts max., or is it something else? Ask Dave, maybe he can set us all straight!!!!
Dave!!!!!!!!!!!!!!!!!!!!

Source record: 38055

the 8 ft francis is a good antenna....top of the francis line
and better than most shorter antennas.....should perform as good
as a 102 steel whip. if you live in an area where you hit it
alot, it will break and it won't handle as much power as the
steel whip. but it will handle all the power I can afford...ha
ha...one of the good things about a FG whip is the whip lash
effect....meaning it will stand up straighter at high speads and
won't go "swish, swish" when you stop....the steel whip however
is a tough old booger. hell ya can't break it and it will
handle all the power you can afford to put to it...

Not really, I have been running one of Professor's amps. I have the pleasure of owning the channel everytime I key my radio up. When you're the most powerful unit out there you don't have these problems. Come down On channel 19 if you want to hear what a real radio sounds like. We're on the side listening in with my "Imaginary" amp.

Source record: 38058

I myself run an X-400 in my suburban on a stock 95 amp alt. I get my name called consitantly in dx on channel 11 and occasionally on channel 6. These being the only 2 channels that I choose to shoot dx on. For local talking i havent had more confidence in being heard around the Chicago area.
The X-400 is about 6 inches tall 13 inches long and 8 inches wide. I see 300 watts avg. power on a Bird 43 with a 500 watt element. I run it with the potentiameter all the way up on the box and a low drive. i key the box so that it deadkeys @ 75 watts then i let that baby swing.

I hope you enjoy your X-400 as much as i enjoy mine.

Changing the coax length does nothing for tuning. Only changing/pruning the antenna elements can accomplish this.
If a certain run or length of coax is "part" of the radiating system, like a tuning or matching stub, that's different. I think most of the people who claim cutting coax changes SWR are being misled by the fact that SWR meters are current or voltage reading units that are fooled by a coax change, but the SWR is going to be the same. You might see a change, but the rig isn't matched any better, and your radio will run because it's been tricked into thinking it sees a match, but not as efficiently as it should.
There are hams and CBers the world over who believe this coax myth because they've seen it in their mobile set ups, and they can't be persuaded to believe otherwise because hey, "I SAW the difference, man!", but it ain't so.
See Joe Carr's Practical Antenna Handbook and the ARRL Handbook (any year).

>neighbourhood, so I am hoping to start off without an amplifier to avoid TV
>interference. Therefore an efficient transfer of output power from the radio
>to the antenna will be important. I am already having to contend with
>possible losses due to the loft roof (wood and shingles).
>
>Thanks,
>
> Richard.
>

You can find the loss figures per 100 ft in a current Radio Shack catalog. At the CB frequencies, the loss for short runs is not significant.

RG-8 has less loss than RG-58, but RG-58 is generally acceptable for CB, unless the run is extremely long, i.e., several hundred feet.

The loft roof will cause some loss, but probably not much. Put up the most efficient antenna possible, i.e., as close as possible to a full size 1/4 wave vertical antenna.

Above all, have fun!

Source record: 38072

If you're going to do that, pull 10 or 8, maybe even 6 or 4. 12 has a lot of resistance (read voltage drop). I once measured a drop of .5 volts thru a 6 foot piece of 6 gauge feeding a 667. That installation was redone with 4 all the way to the battery.

Most vehicles have grommets around the gas and brake pedals. Makes a good place to feed wire without drilling.

Happy Jeeping...Get some mud on those tires! <:

Any one try the I-MAX 2000 antenna.
I am from the 70's and need a setup for the boat to base
I and was looking at all kinds of antennas, all I see is voodoo coils and nonsense.
What happened to the Penetrater, Astroplane, even the Radio Shack 3.75 dB 5/8 wave ?

At best most are 1/2 wave vertical dipoles in fiberglass tubes with some nonsense *DBI* gain ratings.
Does any one know what the I-MAX 2000 gain is over a Antron 99 due to it low angle of RF radiation.

I am concerned about you. This last post seems to confirm my
suspicions about you. You need to visit this page first. Then report
back. Only then can we further evaluate the problem.

It does no such thing. As I said before, give me your antenna
impedance numbers and I'll run the calculations that will
show otherwise.

> Any one who has been into this HAS seen this phenomenon.

Simply not true.

> It is because IF the resonant antenna is not 50 ohms like the
> coax, then a series 1/4 wave section transformation can take
> place.

A coax *always* performs an impedance transformation (it doesn't
even have to be 1/4 wavelength). However, a 50 ohm coax *never*
improves the SWR. The different impedances are all impedances
of constant SWR.

> If this 1/4 wave section is cut to small or to long then
> it will add ind. or cap. reactance. This additional cap.
> or ind reactance can either add or subtract from the
> reactance coming from a non resonant antenna.

It does not merely change the reactance; it changes the resistance,
too. It is performing an impedance *transformation*. At 50 ohms
characteristic impedance, the transmission line *never* changes the
SWR regardless of the length.

> It works out that a less than 50 ohm antenna that uses
> a 18 foot section of 66% coax will increase it's bandwidth
> measured at the radio.

Absolutely not true. Again, give me your antenna impedances
over a certain bandwidth. I will calculate the SWRs with and
without a 1/4 wave section and show that there is no SWR bandwidth
broadening whatsoever.

> A 50 ohm antenna will not show any difference with any coax
> length at the radio.

No disagreement here.

> A greater than 50 ohm antenna will show a narrower bandwidth
> at the radio.

Not true.

> >So, what's the deal-e-o? I say post the JPG image.

Yes, post the JPEG image.

4354. Re: Dave made question still UNanswered !!!

Newsgroup: rec.radio.cb
Date: 2000-06-01 00:00:00 UTC

Message-ID: <017djskoene51l42ivej032j43mtrmfr05@4ax.com>
Source record: 38087

Dave made allows 5 watts. Which means you can put in a 5watts Dead key (No modulation) signal and it will work. Ideally though you can run a 40 watt signal into as well as long as you have a 2.5 to 5 watt dead key with the rest of the 40 watt swing (when audio is applied). this works on the Low drives and the High drive amps which are (5 watts lo drive and 15 watts high drive). rule of thumb is to set your power below what the amp requires as max and then Swing the rest and you will not hurt them as long as the signal is clean and not over modulated.

> change...

Linus, I agree with everything you wrote except this item about the SWR meter being fooled because it is a "current or voltage reading unit." SWR meters are more accurate (in a relative, not absolute sense) than people give them credit for. This claim that they are fooled is more of a cop-out explanation than a reality when one is confronted with an unexpected reading.

I agree that, with all other parameters being equal, the SWR will not change when the transmission line length is changed. However, there are other changes taking place (most notably the line loss is changed). Other explanations for changes in SWR readings include tolerances in the transmission line characteristic impedance (i.e. it may not be exactly 50 ohms).

SWR meters typically sense *both* current and voltage. This is how they are directional couplers. Forward voltage and current are in phase and additively create a forward power reading. Reflected voltage and current are 180 degrees out of phase and additively cancel out to eliminate the reverse power from the forward power reading. Thus, the meter is constructed to perform directional measurements using both voltage and current sensing. It is not a "current or voltage reading unit;" it is a "current *and* voltage reading unit."

Have you self appointed yourself as "The Coax Police"? Because if
you have then you ought to reconsider and go on a leave of absence
for a while. While you're away, take some time off with your nose
firmly out of a book, and vary different coax lengths attached to a
resonant NON 50 ohm antenna. You will find that although the real SWR
